WARRANTY

All TEKTRONIX instruments are warranted against defective materials and workmanship for one year. Any questions with respect to the warranty should be taken up with your TEKTRONIX Field Engineer or representative.

All requests for repairs and replacement parts should be directed to the TEKTRONIX Field Office or representative in your area. This will assure you the fastest possible service. Please include the instrument Type Number or Part Number and Serial Number with all requests for parts or service.

Specifications and price change privileges reserved.

OPERATORS SAFETY INFORMATION

The following general safety information is provided to ensure safe operation of this instrument and applies to all operators and service personnel. Specific warnings will be found throughout the manual where they apply and should be followed in each instance.

WARNING statements identify conditions or practices which could result in personal injury or loss of life.

CAUTION statements identify conditions or practices which could result in damage to the equipment or other property.

The word **DANGER** on the equipment identifies areas of immediate hazard which could result in personal injury or loss of life.

The following safety symbols may appear on the equipment:

CAUTION—Refer to manual

DANGER—High voltage

Protective ground (earth) terminal

Other warning symbols where they apply.

WARNING

Ground the Instrument

To reduce electric-shock hazard, the mainframe (oscilloscope) chassis must be properly grounded. Refer to the mainframe manual for grounding information.

Do Not Operate in Explosive Atmosphere

Do not operate this instrument in an area where flammable gases or fumes are present. Such operation could cause an explosion.

Do Not Remove Instrument Covers

To avoid personal injury, do not operate the instrument without covers installed. Do not perform any servicing other than that contained in the Operators Manual unless you are qualified to do so.

Do Not Service or Adjust Alone

Do not attempt internal service or adjustment unless another person, capable of rendering first aid and resuscitation, is present.

CAUTION

Prevent Instrument Damage

To prevent instrument damage, plug-in units should not be installed or removed without first turning off the mainframe power.

SERVICE SAFETY INFORMATION

The following are safety precautions which appear in the servicing information sections of this manual. This Service Safety Information is in addition to the Operators Safety Information given previously.

WARNING

Disconnect Instrument Power

To avoid electric shock, disconnect the instrument from the power source before soldering or replacing components.

CAUTION

Use Proper Cleaning Agents

Avoid the use of chemical cleaning agents which might damage the plastics used in this instrument. Use a non-residue type of cleaner, preferably isopropyl alcohol, total denatured ethyl alcohol, or TP35. Before using any other type of cleaner, consult your local Tektronix Service Center or representative.

Exercise Care When Checking Diodes

Do not use the ohmmeter on a scale that has high internal current. High currents may damage the diode.

Exercise Care When Soldering on Multi-layer Boards

The Acquisition, Intelligence, and Button Lights circuit boards in this instrument are multi-layer type boards with a conductive path(s) laminated between the top and bottom board layers. All soldering on these boards should be done with extreme care to prevent breaking the connections to the center conductor(s); only experienced maintenance personnel should attempt repair of these boards.

Do Not Use Pin Sockets for Connection Points

The spring tension of the pin sockets ensures a good connection between the circuit board and the pin. This spring tension can be destroyed by using the pin sockets as a connecting point for spring-loaded probe tips, alligator clips, etc.

2150-2

DF1 FEATURES

The DF1 Display Formatter provides data-domain display modes in addition to the existing time-domain display of the 7D01 Logic Analyzer. It adds state table displays with a comparison mode, and a map display. The DF1 attaches to the left side of the 7D01, forming a three-wide plug-in assembly. This assembly operates in a 7000-series oscilloscope mainframe to comprise a complete 16-channel logic timing-state analyzer system.

A microprocessor controlled memory system, contained in the DF1, is capable of recording two 7D01 information records. Portions of both information records may be displayed concurrently in a state table presentation.

State tables are displayed in terms of either hexadecimal, octal, or binary formats. This data may be displayed in up to two tables of 17 lines of 16-bit words each. The left-hand table displays data currently stored in the 7D01 memory (7D01 display). The right-hand table displays data that has been transferred from previous 7D01 displays to the DF1 memory (reference display). The DF1 compares the 2 tables and resets the 7D01 when the 7D01 data equals the reference data.

The map function plots a dot display of the 16 data channels in X-Y coordinate points. Each dot location represents one possible combination of up to 16 inputs to the 7D01

GENERAL INFORMATION

INTRODUCTION

The Operator's Manual contains information necessary to effectively operate the DF1 Display Formatter unit and is divided into three sections: Section 1 provides packaging for shipment information, specifications, and a list of standard accessories. Section 2 contains operating information. Information concerning available options is located in Section 3.

The Instruction Manual contains nine sections. Operating information is covered in the first two sections; servicing information is covered in the remaining seven sections. Schematic diagrams are located at the rear of the manual and can be unfolded for reference while reading other parts of the manual. The reference designators and symbols used on the schematic diagrams are defined on the first page of the Diagrams and Circuit Board Illustrations section. Abbreviations used in the manuals, except in the parts list and schematic diagrams, comply with the American National Standards Institute Y1.1-1972 publication. The parts list is a computer printout and uses computer-supplied abbreviations.

GLOSSARY OF TERMS

The following logic terms are used throughout this manual.

Asynchronous Mode—The data is acquired by the 7D01 using its internal clock at a rate selected by its sample interval control.

Bit—The smallest increment of digital information.

Blanked Columns—The columns eliminated from the memory by the COLUMN BLANK function.

Compare—A check between the 7D01 memory and the reference memory for equality (a microprocessor function.)

Data—This is information acquired by the 7D01. Up to 16 channels of data may be acquired, and each data bit is one clock period in the synchronous mode.

Data Record—All of the information stored in the 7D01 memory or the DF1 memory. (A Data Record has 4096 bits of information.)

Data Word—This is Good Data that may be formatted in any of three different ways:

1. A vertical slice of the Timing Diagram display.
2. A coordinate point of the Map display.
3. A horizontal line of characters in a State Table display.

NOTE

Channel 0 is the top-most channel displayed in TIMING DIAGRAM format and is always considered the least significant bit.

Don't Care Data—Invalid Data that is excluded from comparison in all comparison modes.

End Data—Data that fills out the last portion of a table when valid data ends before completion of the table. This is indicated by an "*" in the display.

Good Data—All data which is not Invalid Data.

Indeterminate Data—This is valid data but is considered invalid because its location cannot be defined. This data is indicated by an "X" in the display and occurs during sweep retrace in Timing Diagram. The number of Indeterminate Data bits for each position of the 7D01 bits/channel switch are: Two bits (254 bits/channel position), four bits (508 bits/channel position), and eight bits (1016 bits/channel position).

Invalid Data—This term describes a combination of Indeterminate Data, Old Data (if any), and End Data.

New Data—The most recent acquisition of Good Data into the 7D01.

Old Data—Data which was part of a previous Data Record in the 7D01 memory but is out of sequence. This is caused by the arrival of the trigger before the New Data has completely filled the memory. Old Data is indicated by an "X" in the display.

Reference State Table—A display of DF1 memory data transferred from a previous 7D01 display and displayed on the right half of the crt.

Synchronous Mode—The data is acquired by the 7D01 using an externally supplied clock signal (7D01 sample interval switch set to external, and with the external clock signal connected to the clock input of the channel 0-7 Data Acquisition Probe).

Word—See Data Word.

INSTALLATION

The DF1 Display Formatter attaches to the left side of the 7D01 Logic Analyzer to make a three-wide plug-in system. The two units latch together to provide a rigid instrument that plugs into a 7000-series mainframe. Refer to Figure 1-1 to attach the DF1 to the 7D01.

CAUTION

To prevent instrument damage, plug-in units should not be installed or removed without first turning off the mainframe power.

To install the DF1/7D01, first turn off the power to the oscilloscope mainframe. Then, gently push the 2 plug-in units into the appropriate plug-in compartments until they fit firmly. The front panels of the DF1/7D01 should be flush with the front panel of the oscilloscope mainframe.

NOTE

When installed in a four-compartment mainframe, the DF1/7D01 occupies the left vertical, right vertical, and A horizontal compartments only. The oscilloscope mainframe vertical mode switch must be set to right and the horizontal mode switch must be set to A.

To remove the DF1/7D01, pull the release latch (located on the lower left corner of the 7D01) to disengage the DF1/7D01 from the mainframe. Then, gently slide the plug-in units from the mainframe.

PACKAGING FOR SHIPMENT

If this instrument is to be shipped for long distances by commercial transportation, it is recommended that the instrument be packaged in the original manner for maximum protection. The carton and packaging material in which your instrument was shipped should be saved and used for this purpose.

Also, if this instrument is to be shipped to a Tektronix Service Center for service or repair, attach a tag to the instrument showing the following: Owner of the instrument (with address), the name of an individual at your firm that can be contacted, complete instrument type and serial number, and a description of the service required.

If the original packaging is unfit for use or not available, package the instrument as follows:

1. Obtain a carton of corrugated cardboard with at least a 200-pound test strength and at least 6 inches larger than the instrument dimensions to allow for cushioning.

2. Surround the instrument with polyethylene sheeting to protect the instrument.

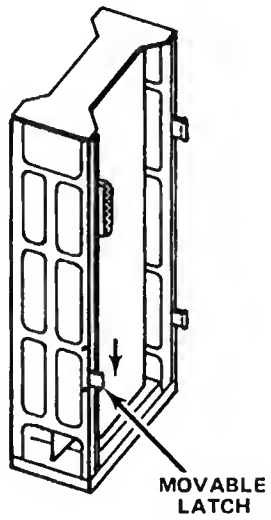
3. Allow a 3-inch cushion on all sides by tightly packing dunnage or urethane foam between the carton and the instrument.

4. Seal the carton with shipping tape or with an industrial stapler.

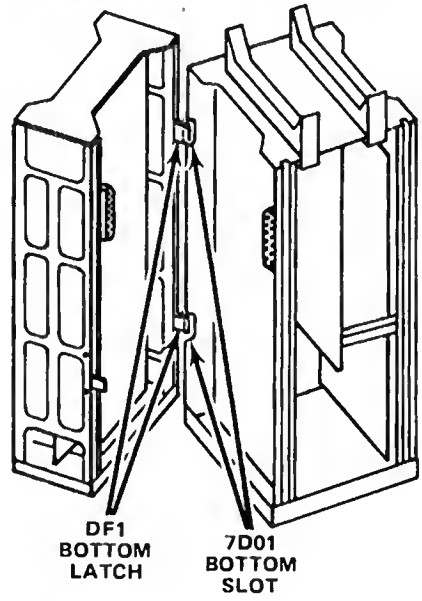
5. Mark the address of the Tektronix Service Center and your return address on the carton in one or more locations.

DF1/7D01 INSTALLATION

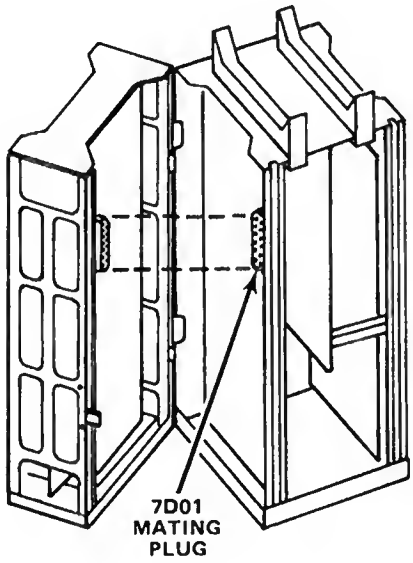
(1) Slide the movable latch on the top of the DF1 forward until it stops.



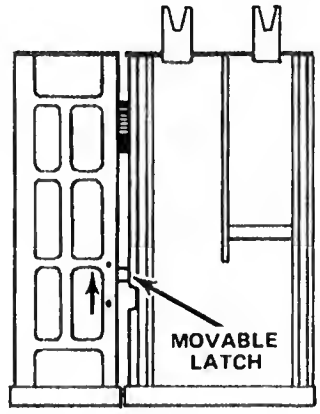
(2) Tilt the DF1 and 7D01 slightly and place the bottom two latches on the DF1 into the bottom two slots on the 7D01. Gently slide the DF1 forward to just engage the bottom latches with the bottom treck on the 7D01.



(3) Continue to slide the DF1 forward until the jack at the top rear of the DF1 lines up with its meting plug on the 7D01.



(4) Gently press the units together until the connector is properly mated and the movable latch is inserted into the rail slot on the 7D01.



Make sure the movable latch fits into the 7D01 rail groove and slide the movable latch toward the rear along the rail groove until it stops. The DF1 and 7D01 should now be latched together to form a rigid three-wide plug-in system.

2150-10

Figure 1-1. Atteching the DF1 to the 7D01.

SPECIFICATION

The electrical specifications listed in Table 1-1 apply for the DF1/7D01 system under the following conditions: (1) The instrument must have been adjusted at an ambient temperature between +20° and +30° C (+68° to +86° F), (2) the instrument must be operating in an ambient temperature between 0° and +40° C (+32° and +104° F), and (3) the instrument must have been operating for at least 20 minutes.

TABLE 1-1

Electrical Characteristics

Characteristic	Performance Requirement
External Read Clock	
Frequency Range	100 kHz to 500 kHz.
Duty Cycle	50% within 5%.
Display	
Vertical Size	Adjustable from 6.9 div or less to at least 8.1 div from the top of the first line of DF1 readout to the bottom of the last line of DF1 readout.
Vertical Position	Adjustable to vertical center of display area in any calibrated 7000-series mainframe.
Horizontal Position	Adjustable to horizontal center of display area in any calibrated 7000-series mainframe.
Output Signals	
Reset Logic Voltage Level	LO: +0.4 V or less at 2 mA. HI: at least +2.4 V at 2 mA.
Waveshape	Positive-going rectangular pulse.
Duration	100 μs within 50 μs when used with the 7D01 internal read clock.

TABLE 1-2

Environmental Characteristics

Characteristic	Performance Requirement
Temperature	
Calibration	+20° to +30° C (+68° to +86° F).
Operating	0° to +40° C (+32° to +104° F).
Storage	−55° to +75° C (−67° to +167° F).
Altitude	
Operating	To 15,000 feet.
Storage	To 50,000 feet.
Transportation	Qualified under National Safe Transit Committee Test Procedure 1A, Category II.

TABLE 1-3

Physical Characteristics

Characteristic	Description
Net Weight	Approximately 2 lbs (0.9 kg).
Overall Dimensions	See Figure 1-2, Dimensional Drawing.

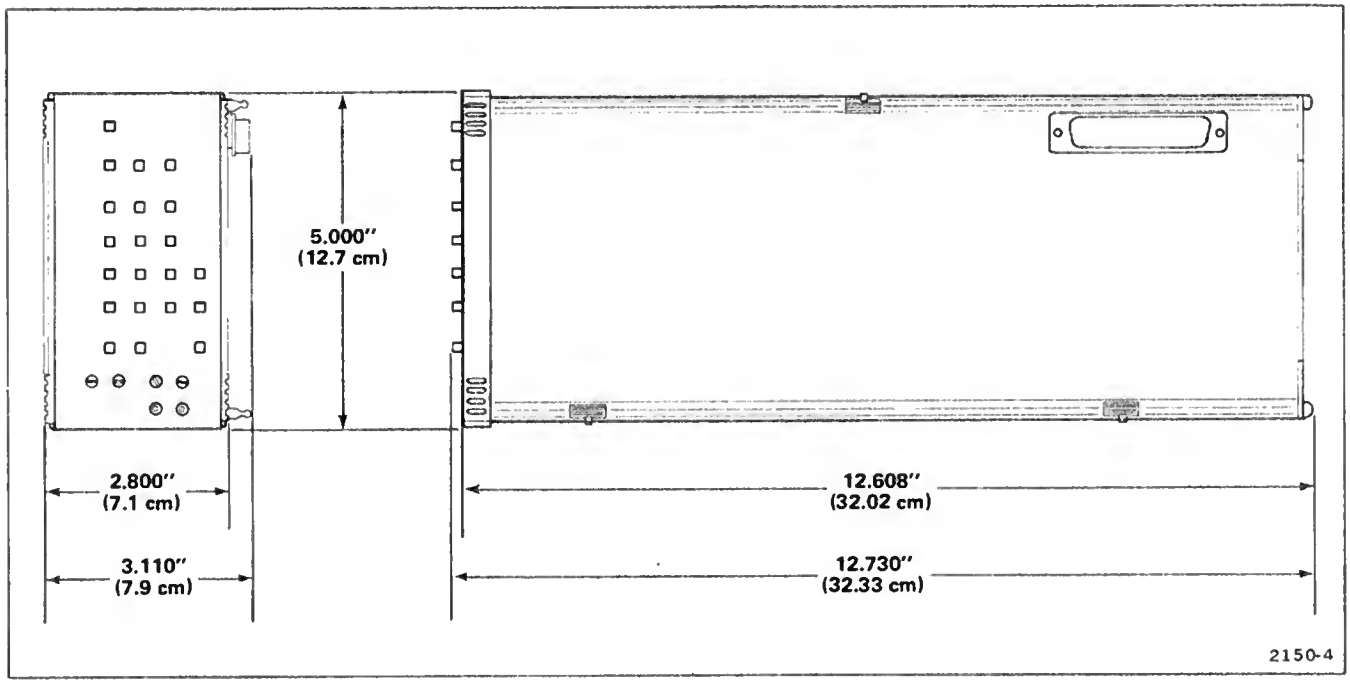


Figure 1-2. DF1 dimensional drawing.

STANDARD ACCESSORIES

1 ea . . . . . .Operators Manual

1 ea . . . . . .Instruction Manual

Refer to the tabbed Accessories page in the back of this manual for standard accessory part numbers.

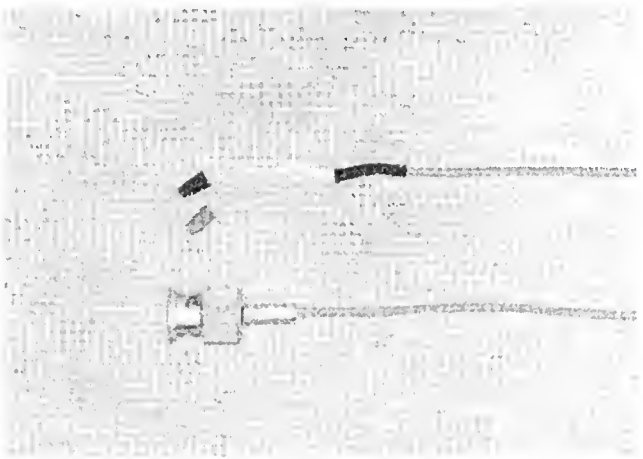
RECOMMENDED ACCESSORIES

The following accessories have been selected from our catalog specifically for your instrument. They are listed as a convenience to help you meet your measurement needs. For detailed information and prices, refer to a Tektronix Products Catalog or contact your local Tektronix Field Representative.

CABLE

TWO-PIN TO BNC: This adapter-cable connects the output gate and ground pin-jacks on the DF1 front panel to an external application.

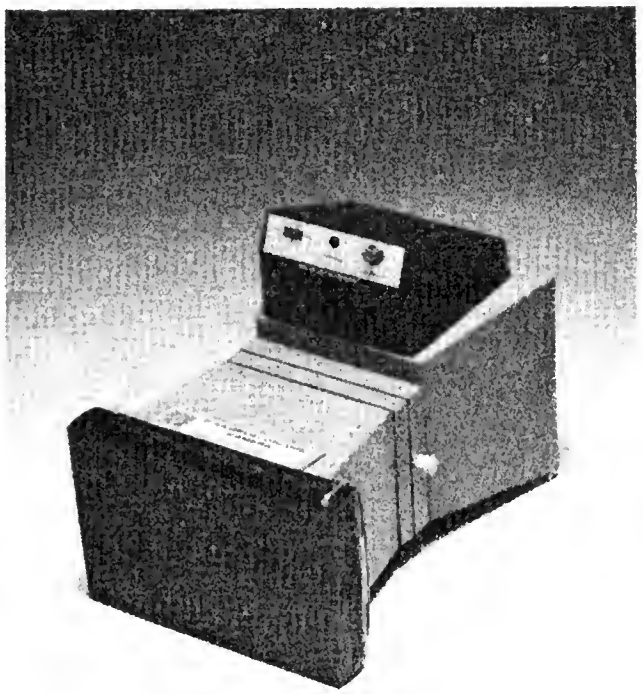
Cable, Order 175-1178-00



CAMERA

C-5A: The C-5A is a low-cost general-purpose camera with a Polaroid Pack-Film Back, pulsed graticule illumination, and a fixed f/16 lens. Magnification may be set at 0.67 or 0.85.

Order C-5A



OPERATING INSTRUCTIONS

To effectively use the DF1 Display Formatter, the capabilities of the DF1 and the companion 7D01 Logic Analyzer must be known. This section briefly describes the operation of the controls and connectors, provides detailed operating instructions, and a functional check procedure for the DF1. The General Information section provides instructions for installation of the DF1 and the 7D01 into a 7000-series oscilloscope mainframe. Refer to the 7D01 Operators or Instruction Manuals for information on the 7D01 Logic Analyzer.

CONTROLS AND CONNECTORS

INTERNAL

The Readout Source jumper is located inside the DF1. When using the Timing Diagram display, readout can be produced either by the DF1 readout system or by the readout system of the associated oscilloscope mainframe (refer to Figure 2-1). We recommend using the DF1 readout unless it is important to have the style of characters produced by the mainframe readout system.

EXTERNAL

The major controls required for operation of the DF1 are located on the front panel of the unit. Figure 2-2 provides a brief description of the front-panel functions. More information is given under Detailed Operating Instructions.

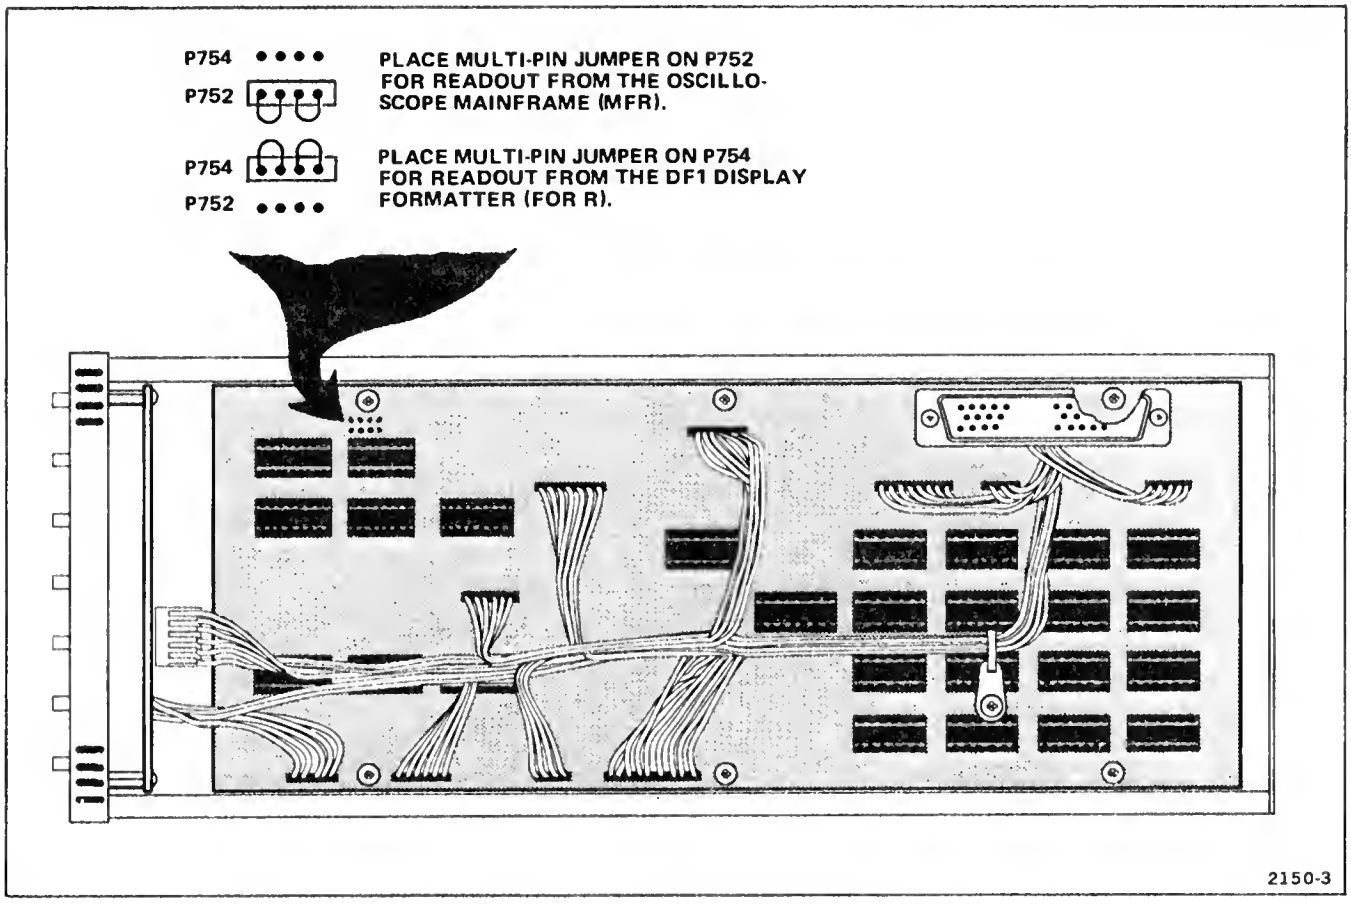


Figure 2-1. Location of the Readout Source multi-pin jumper.

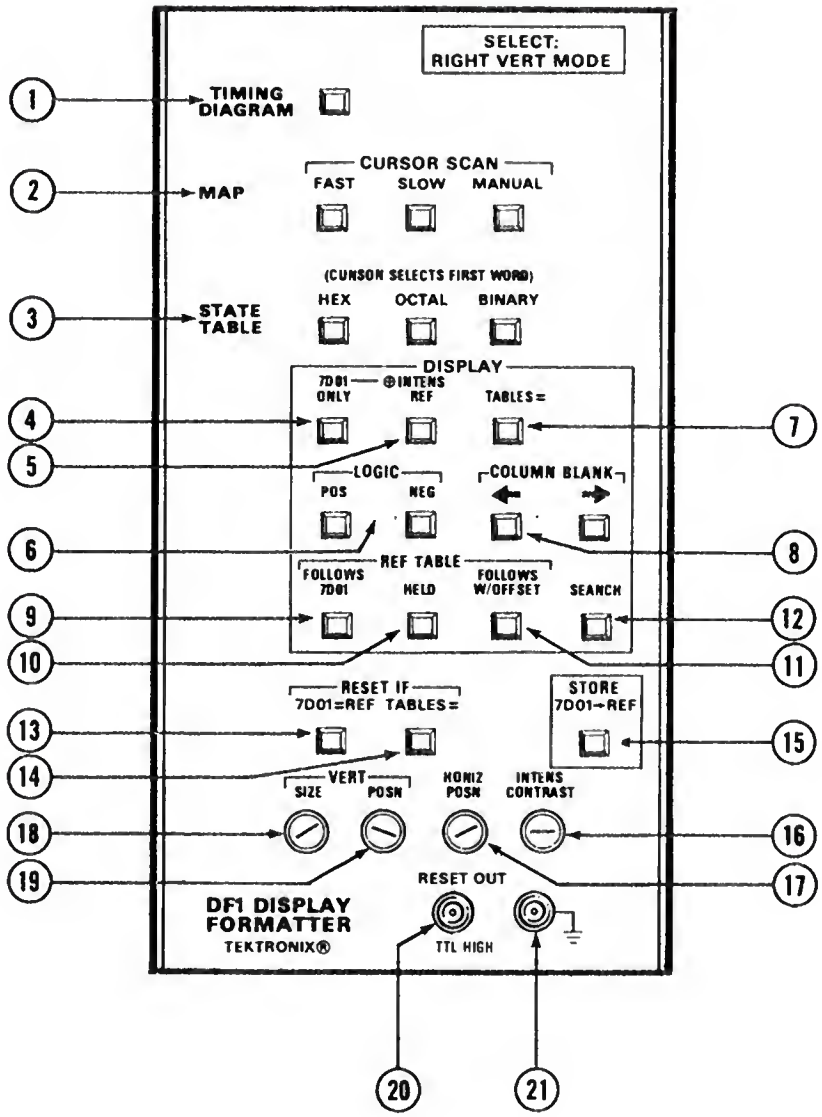

Figure 2-2. Front-panel controls, connectors, and indicators.

(1) **Timing Diagram Switch**—Selects the timing diagram display from the 7D01 Logic Analyzer.

(2) **MAP (CURSOR SCAN Switches)**—Select view of the 7D01 memory data in X-Y coordinate points on the oscilloscope mainframe crt. The DF1 automatically sequences the data locations at a FAST or SLOW rate, or data locations are selected manually with the 7D01 Cursor control.

(3) **STATE TABLE Switches**—Select tabular display of the cursor word, the 16 words following the cursor word, and the trigger word. The tabular format can be displayed in HEX (hexadecimal), OCTAL, or BINARY base-number systems.

(4) **7D01 ONLY Switch**—Selects the state table from the 7D01 memory for display on the left-hand side of the crt.

(5) **⊕(Exclusive Or) INTENS REF Switch**—Compares state table display from the 7D01 memory (left-hand column) to a reference state table stored by the DF1 (right-hand column).

(6) **LOGIC Switches**—Determine whether the state table displays are in positive or negative logic.

(7) **TABLE = Indicator**—Lamp turns on when the 7D01 state table and the reference state table are equal.

(8) **COLUMN BLANK Switches**—Provide column blanking for state table displays. The blanked columns are excluded from the data base for all state table comparison and reset functions.

(9) **REF TABLE FOLLOWS 7D01 Switch**—The cursor location (trigger-to-cursor difference) in the reference state table (right-hand column) follows the cursor location in the 7D01 state table (left-hand column).

(10) **REF TABLE HELD Switch**—Locks the cursor location in the reference state table which allows the cursor location in the 7D01 reference state table to be moved independently.

(11) **REF TABLE FOLLOWS W/OFFSET Switch**—Maintains the cursor location offset, between the 7D01 and reference state tables, that was established in the REF TABLE HELD mode.

(12) **SEARCH Switch**—The 7D01 memory is searched for a match of the cursor word (first word) in the reference state table.

(13) **RESET IF 7D01 = REF Switch**—The 7D01 memory is reset when the 7D01 memory equals the DF1 reference memory.

(14) **RESET IF TABLES = Switch**—The 7D01 memory is reset when the 7D01 state table display equals the reference state table display.

(15) **STORE 7D01→REF Switch**—Transfers the 7D01 memory into the DF1 reference memory.

(16) **INTENS CONTRAST Adjustment**—Controls brightness of the intensified characters of the DF1 display.

(17) **HORIZ POSN Adjustment**—Controls horizontal position of the DF1 display.

(18) **VERT SIZE Adjustment**—Varies vertical size of the DF1 display.

(19) **VERT POSN Adjustment**—Controls vertical position of the DF1 display.

(20) **RESET OUT Connector**—Pin-jack connector provides a HIGH TTL level output when the 7D01 memory is reset by the DF1.

(21) **Ground Connector (⏚)**—Pin-jack connector provides a ground return for the RESET OUT gate.

2150-1B

Figure 2-2. Front-panel controls, connectors, and indicators (continued).

DETAILED OPERATING INSTRUCTIONS

POWER-ON MODE

When power is applied to the oscilloscope mainframe (Power-On mode), the DF1 reference memory and the memory which acquires data from the 7D01 are checked for proper operation of the random access memory (RAM) integrated circuits (refer to Error Message Displays in this section). Then, the 7D01 is reset and the DF1 reference memory and the 7D01 memory are cleared. The Display Mode is automatically set to Timing Diagram, the LOGIC is set to POS, and the cursor location (trigger-to-cursor readout) is set to +0. All other DF1 push-button selections are cancelled.

DISPLAY MODES

The DF1 displays digital data in 3 Display Modes: Timing Diagram, Map, and State Table. Figure 2-3 shows the controls required to activate typical DF1 displays.

Timing Diagram Displays

The front-panel TIMING DIAGRAM push button selects the Timing Diagram display (4, 8, or 16 channels) from the comoanion 7D01 Logic Analyzer (see Fig. 2-3). The cursor function of the 7D01 provides an intensified zone on the data display and a corresponding numerical readout display shows the logic state for each displayed channel of data. The position of the cursor, relative to the trigger, is also displayed on the crt readout. Refer to the 7D01 manual for more information on the 7D01 Logic Analyzer.

The source of the display readout can be from the oscilloscope mainframe readout system (MFR) or the DF1 (FOR R). (Refer to Internal Controls and Connectors, in this section, for more information.) When the Timing Diagram Display Mode is selected (Readout Source jumper set to Formatter Readout) after either the HEX, OCTAL, or BINARY State Table function has been displayed, the cursor word readout is displayed in the same base-number system as displayed previously in the State Table Display Mode. Then, the cursor word readout changes between binary and the base-number system in the previously selected State Table Display Mode, with every other push of the TIMING DIAGRAM push button. However, if the Readout Source jumper is set for mainframe readout (MFR), cursor word readout is displayed only in the binary system.

Map

The Map function provides a view of the 7D01 memory displayed as x-y coordinate dots on the crt. The vertical axis represents the most significant half of the data word and the horizontal axis represents the least significant half (see Figure 2-3).

The map display can be formatted from 4, 8, or 16 channels of input data. Therefore, 4- and 8-channel map displays are plotted over the entire crt display area in the same manner as a 16-channel display. A 16-channel display is capable of 64,000 coordinate points, an 8-channel display is capable of 256 coordinate points, and a 4-channel display is capable of 16 coordinate points.

A map cursor, indicated by a plus symbol (+), sequences automatically through the data locations in the order in which the data was loaded into memory. The cursor scans at a FAST or SLOW rate, as determined by the CURSOR SCAN push buttons. When either the FAST or SLOW push button is held in, the cursor scan is stopped near a desired location on the display and can be positioned to the exact location with the 7D01 cursor position controls. Also, when the MANUAL CURSOR SCAN push button is pressed, the 7D01 cursor position controls are used to manually position the cursor to the exact position desired. The readout display shows the logic state of the cursor word (bottom of crt), and the position of the cursor point, relative to the trigger point, is displayed at the top of the crt.

The map display is particularly useful for a fast overall check of digital systems. First of all, the map display pattern for a particular set of digital inputs must be known. Then, if there is a change in any one of the input signals, the map display pattern will change. A different map display pattern indicates that the circuits are not operating in the normal manner. Figure 2-4 illustrates a map display pattern from 16 signal inputs and shows that the map display pattern changes when input signals are removed.

State Table Displays

The State Table function enables the data, recorded in the 7D01, to be displayed in a tabular format. The cursor word, the sixteen words which follow, and the trigger word are

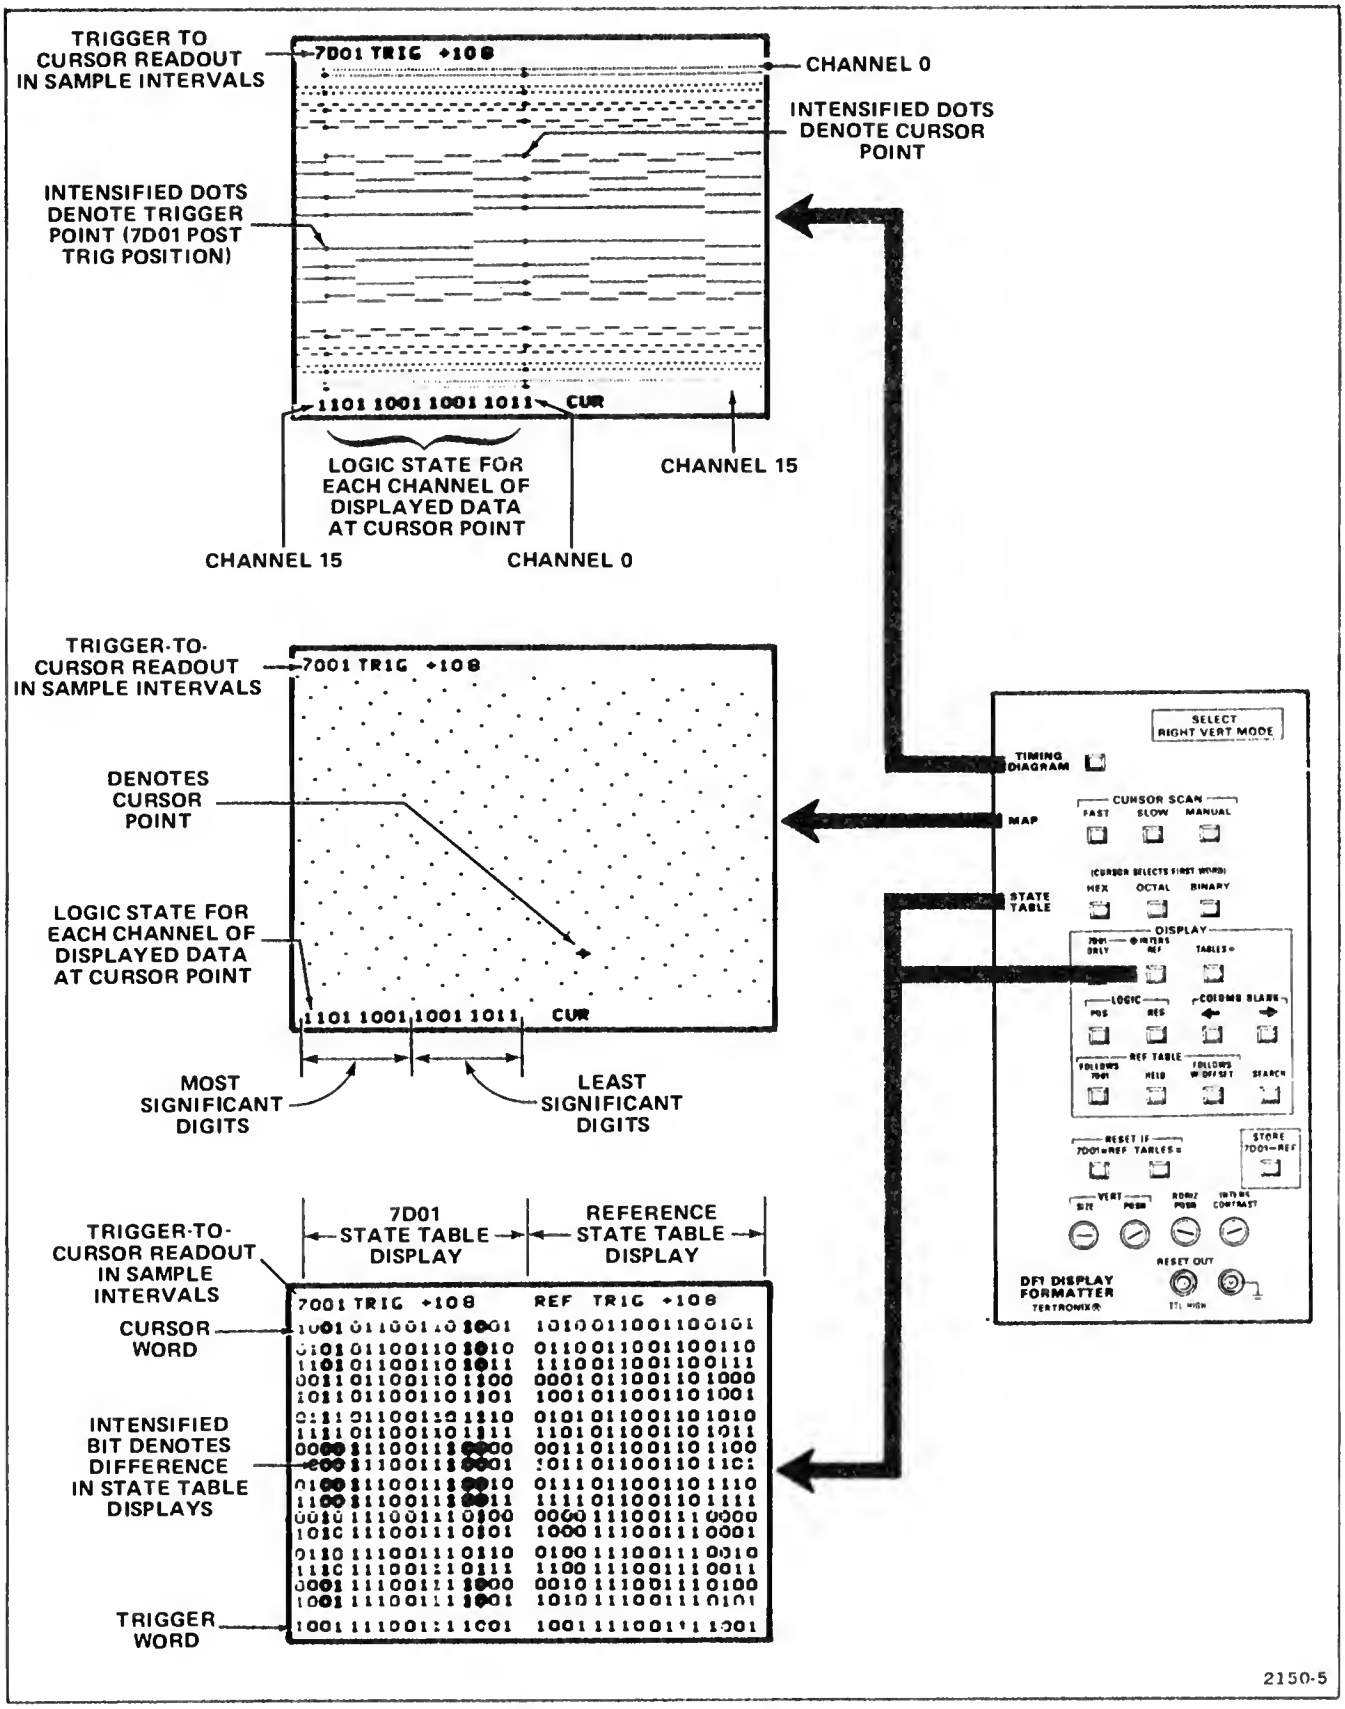

Figure 2-3. Typical DF1 Display Modes.

displayed. If the trigger word is displayed in the first 17 words of the state table, it is indicated by a blinking condition. The position of the cursor, relative to the trigger, is also displayed on the crt readout (see Figure 2-3).

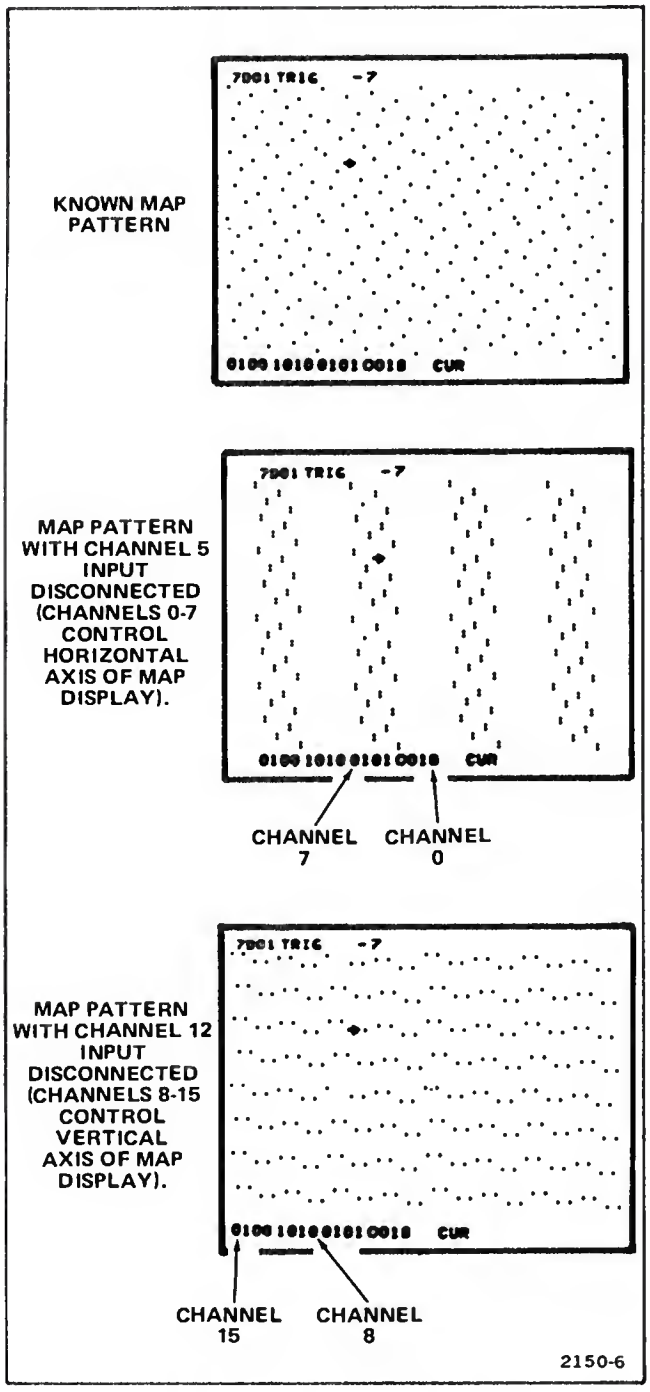

Figure 2-4. Typical map display usage.

Each time the 7D01 cursor position is changed or the 7D01 is reset, the display is updated. If the data ends before 17 words are displayed, the remainder of the display is filled with an asterisk (*) character. Any "old data" from the 7D01 memory is indicated by an "X" character.

Three push-button switches select State Table displays in HEX (hexidecimal, base 16), OCTAL (base 8), or BINARY (base 2) codes. The digits are grouped in threes or fours depending upon the setting of the 7D01 cursor byte switch.

7D01 ONLY. The State Table display from the 7D01 is displayed on the left side of the crt. The ⊙ INTENS REF displays are not functional in the 7D01 ONLY mode.

7D01 ⊙ INTENS REF. Two state tables are displayed simultaneously on the crt. The state table from the 7D01 is displayed on the left half of the crt and a reference state table is displayed on the right half of the crt (see Figure 2-3). When the 7D01 ⊙ INTENS REF is initially selected, the STORE 7D01→REF push button must be pressed to load the reference memory. Any differences between the 7D01 and reference state tables are indicated by intensified bits at the appropriate location in the 7D01 state table. Any differences in the state tables due to old data, indeterminate data, end data, or blanked columns, is interpreted as "don't care" conditions and are not intensified in the 7D01 state table (refer to the Glossary in the General Information section). If there are no differences between state tables, the TABLES= indicator is illuminated.

REF TABLE FOLLOWS 7D01. The FOLLOWS 7D01 mode is functional only when operating in the 7D01 ⊙ INTENS REF mode. The cursor location (trigger-to-cursor readout) in the reference state table is aligned with the cursor location of the 7D01 state table. As the 7D01 location is changed (by means of the 7D01 cursor position or data position controls), the cursor location of the reference state table follows.

REF TABLE HELD. The HELD mode is functional only when operating in the 7D01 ⊙ INTENS REF mode. The reference table cursor location remains at one setting, allowing the cursor location in the 7D01 state table to be moved independently (offset). Refer to Figure 2-5.

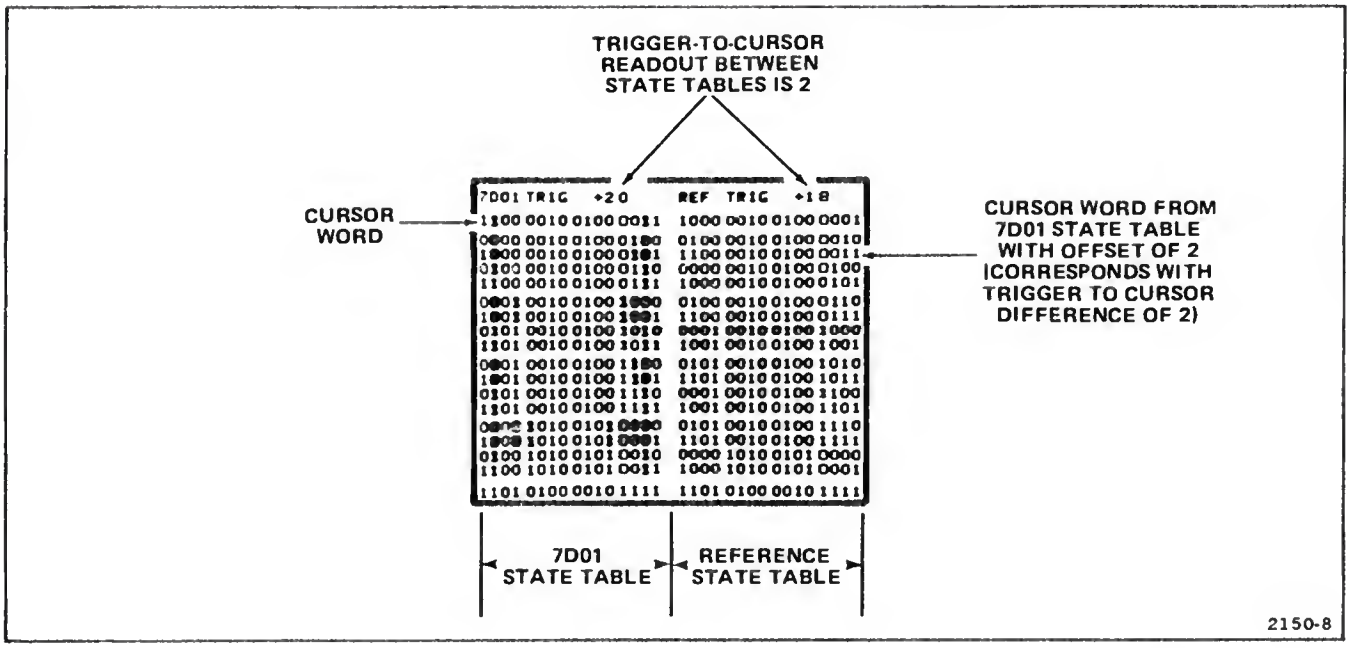

Figure 2-5. Typical state-table display showing offset between the 7D01 and reference state tables.

REF TABLE FOLLOWS WITH/OFFSET. The FOLLOWS WITH/OFFSET mode is functional only when operating in the 7D01 ⊕ INTENS REF mode. The difference in cursor location (offset) between the 7D01 state table and the reference state table, is maintained at the time the FOLLOWS W/OFFSET push button is pressed (see Figure 2-5). The offset between the 7D01 and reference state tables remains constant as the 7D01 cursor is moved. To delete the trigger-to-cursor offset, select REF TABLE FOLLOWS 7D01.

SEARCH. The SEARCH mode is functional when operating in the 7D01 ⊖ INTENS REF mode. When the SEARCH push button is pressed, the 7D01 memory is searched for a match of the reference cursor word. When a match of the reference cursor word is found, the REF TABLE mode is automatically set to HELD and the matching word is moved to the 7D01 cursor word position (first word) of the 7D01 state table.

If a match for the cursor word is not found in the 7D01 memory, the state table display remains unchanged. Also, if the first word in the reference memory is not valid, or a comparison is presently being made in the RESET IF 7D01=REF mode, a search of the 7D01 memory is not made.

RESET IF TABLES=. This mode is functional only when operating in the 7D01 ⊙INTENS REF mode. When the RESET IF TABLES= push button is pressed, the 7D01 resets and compares the data in the 7D01 state table to the data in the reference state table. If there are no differences, the 7D01 resets, acquires new data, and repeats the comparison. The number of resets is displayed on the crt readout. If there are differences, the acquisition, compare, and reset cycle stops. The differences between state-table displays are intensified in the 7D01 state table. To cancel the RESET IF TABLES= function, a second push of the RESET IF TABLES= push button is required.

RESET IF 7D01=REF. This mode is functional when operating in all DF1 display modes. When the RESET IF 7D01=REF push button is pressed, the data in the 7D01 memory is compared to the data in the reference memory. If there are no differences, the 7D01 resets, acquires new data, and repeats the comparison. The number of resets is displayed on the crt readout. If there are differences, the acquisition, compare, and reset cycle stops. The cursor word is moved to the first difference and the RESET IF 7D01=REF function is canceled. The RESET IF 7D01=REF function may also be canceled with a second push of the RESET IF 7D01=REF push button.

STORE 7D01→REF. This mode is functional in all DF1 display modes (Timing Diagram, Map, and State Table). When the STORE 7D01→ REF push button is engaged, the 7D01 memory is transferred into the DF1 reference memory. When the trigger-to-cursor readout is the same in both state table displays, the 7D01 state table is transferred into the reference state table with no intensified bits. However,

if the trigger-to-cursor readout of the state table displays is offset, the 7D01 state table will be transferred to the reference state table with that offset (intensified bits may appear). The tables are equal but offset by the trigger-to-cursor readout (see Figure 2-5). To make the tables equal, either set the 7D01 cursor position controls so that the trigger-to-cursor readout is the same for both state tables or press the REF TABLE FOLLOWS 7D01 push button.

COLUMN BLANKING. Column blanking is functional when operating in any State Table mode. Undesired vertical columns of data can be blanked from the state-table displays (COLUMN BLANK→ push button). The blanked columns are interpreted as "don't care" information for state table comparisons and reset functions (refer to the Glossary in the General Information section). To restore a blanked column, press the COLUMN BLANK← push button. The column blanking function is automatically reset to display or compare all columns when the TIMING DIAGRAM, MAP, STATE TABLE (HEX, OCTAL, BINARY), 7D01 ONLY, or 7D01⊕ INTENS REF push buttons are pressed.

LOGIC STATES. When POS LOGIC is selected, the most positive voltage level is interpreted as a logic HI and the most negative level is interpreted as a logic LO. When NEG LOGIC is selected, the most negative level is displayed as a logic HI and the most positive level is interpreted as a logic LO.

Size and Position Adjustment

The controls used to adjust the size and position of DF1 displays depend on the Display Mode selected.

When operating in the Timing Diagram Display Mode, positioning of the timing diagram display is controlled by the 7D01 vertical and horizontal position controls. The size of the timing diagram display is determined by the 7D01 vertical and horizontal magnification controls. Vertical positioning of the display readout is controlled by the DF1 front-panel VERT SIZE and VERT POSN adjustments and horizontal positioning is controlled by the DF1 HORIZ POSN adjustment.

When operating in the Map or State Table Display Modes, vertical and horizontal positioning of the entire display (data and readout displays) is controlled by the DF1 front-panel VERT POSN and HORIZ POSN adjustments. Vertical height of the entire display is controlled by the DF1 front-panel VERT SIZE adjustment.

Error Message Displays

Two error messages are provided on the crt readout to identify operator error and instrument failures.

SEE MANUAL CUR CAN'T MOVE. This error message generally occurs when the 7D01 cursor control is set between switch detents. When the error message appears on the crt, move the 7D01 cursor control into a switch detent and the error message should disappear. If the error message does not disappear, refer to the error message discussion in the Maintenance section of the DF1 Instruction Manual.

SEE MANUAL BAD RAM. This error message indicates that a random access memory (RAM) integrated circuit has failed. To test the DF1 for a bad RAM: Turn off power to oscilloscope mainframe, wait a short time, and turn power on (Power-On Mode). Then check the crt readout for an error message. If the error message appears on the crt readout, refer to the error message discussion in the Maintenance section of the DF1 Instruction Manual.

FUNCTIONAL CHECK

The following procedure is provided for familiarization and for checking basic instrument functions of the DF1 Display Formatter. Refer to the Controls and Connectors discussion while performing this procedure. If a malfunction or possible improper adjustment is revealed while performing this procedure, first check the operation of the 7D01 and associated oscilloscope mainframe, then refer to the DF1 Instruction Manual for troubleshooting and adjustment procedures.

The functions are checked without removing the covers or making internal connections. Performance requirements, functions which require removal of side panels, and detailed checks of the DF1 memory are provided in the Performance Check and Adjustment procedures in the DF1 Instruction Manual.

SETUP PROCEDURE

1. Attach the DF1 Display Formatter to the 7D01 Logic Analyzer and install the three-wide plug-in assembly into the oscilloscope mainframe (refer to Installation, in the General Information section, for assembly instructions). Set the oscilloscope mainframe to display the right vertical and A horizontal compartments.

2. Connect the Interface Test Fixture to the 7D01 as shown in Figure 2-6.

3. Set the 7D01 Logic Analyzer controls as follows:

Sample Interval	Ext
Record Display Time	∞
Data Position	Post Trig
Data Channels	0-15
Trigger Source	W.R.
Word Recognizer	CH 0 through CH 6—LO CH 7—HI CH 8 through CH 15—X External Qualifier—X Probe Qualifier—X
W.R. Mode	Sync
Threshold Voltage	TTL (+1.4 V)

4. Perform the Power-On function (turn mainframe power off, wait a short time, then turn power on).

TIMING DIAGRAM DISPLAY

1. Perform the Setup Procedure.

2. Check crt display for a 16-channel timing diagram (refer to Fig. 2-3). It may be necessary to adjust the mainframe intensity and the 7D01 vertical and horizontal position/magnification controls.

3. Check that the trigger-to-cursor readout is zero and that the intensified cursor point is superimposed on the intensified trigger point (left-hand side of the crt display).

4. Set the 7D01 Data Position switch to Center and press the Record Manual Reset push button. Check that the trigger point (intensified dots) is near the center of the crt display and that the trigger-to-cursor readout is approximately −112. Rotate the 7D01 Cursor Fine Position control and note that the cursor point (indicated by intensified dots on the left side of the 16-channel display) moves in 1-bit increments as shown by the trigger-to-cursor readout. Rotate the 7D01 Cursor Coarse Position control and note that the cursor point moves in 16-bit increments. Note that the logic state for each channel of displayed data (16-bit readout at bottom of crt) changes corresponding to the cursor position. Set the 7D01 Cursor Position controls for a trigger-to-cursor readout of zero. Check that the intensified cursor point is superimposed on the intensified trigger point (center of crt).

5. Set the 7D01 Data Position switch to Pre Trig and press the Record Manual Reset push button. Check that the trigger point (intensified dots) is at the right-hand side of the display and that the trigger-to-cursor readout is approximately −112. Set the 7D01 Cursor Position controls for a trigger-to-cursor readout of zero. Check that the intensified cursor point is superimposed on the intensified trigger point (right-hand side of crt display).

MAP DISPLAYS

1. Perform the Setup Procedure.

2. Press the MANUAL MAP push button. Check crt display for a diagonal line on the crt (see Fig. 2-7).

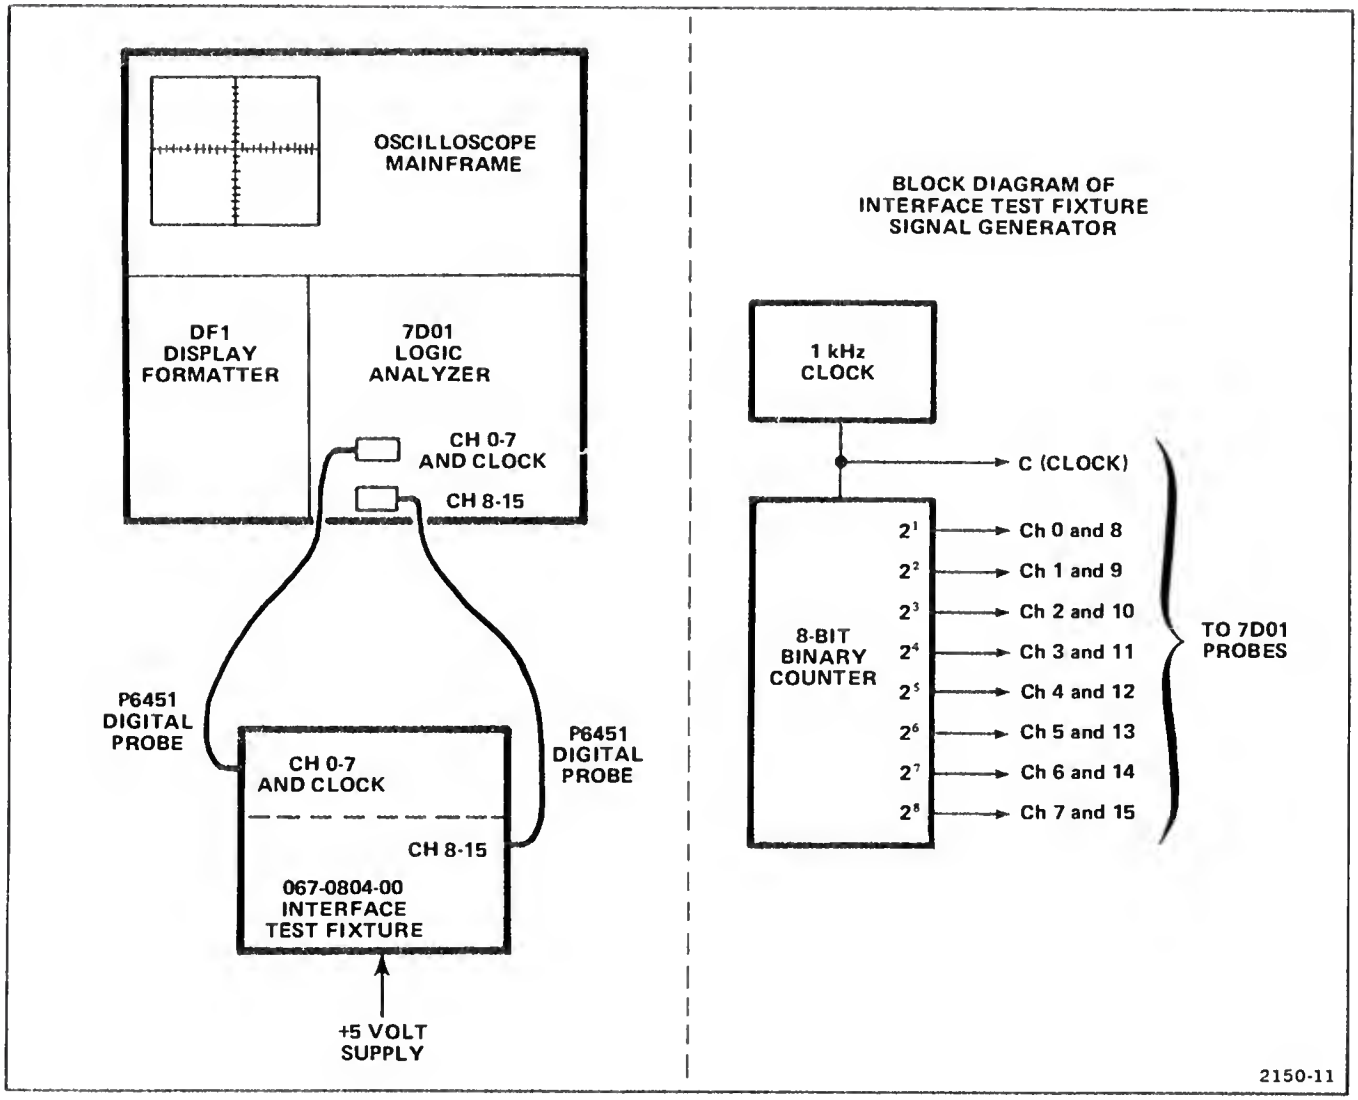

Figure 2-6. Test setup for Functional Check procedure.

3. Rotate the 7D01 Cursor Position controls and note that the cursor point (indicated by a + symbol) can be manually sequenced through the Data as indicated by the trigger-to-cursor readout.

4. Press the SLOW MAP push button and check that the cursor symbol sequences automatically through the data at a slow rate. Press the FAST MAP push button and check that the cursor sequences through the data at a fast rate.

5. Disconnect the channel 5 input from the Interface Test Fixture. Press the 7D01 Record Manual Reset push button and check that the Map display changes to 2 broken diagonal lines (see Fig. 2-8). Reconnect the channel 5 input signal.

STATE TABLE DISPLAYS

1. Perform the Setup Procedure.

2. Press the STATE TABLE HEX push button. Then, press the TIMING DIAGRAM push button and check for 16 channels of data on the crt. Note the logic-state readout of the cursor word, in hexadecimal code, at the bottom of the crt.

3. Press the STATE TABLE HEX and 7D01 ONLY push buttons. Check for a State Table display on left side of the crt in hexadecimal code (base 16). Note that the cursor word (top word in state table) is the same as the cursor word in the Timing Diagram display noted in step 2 and

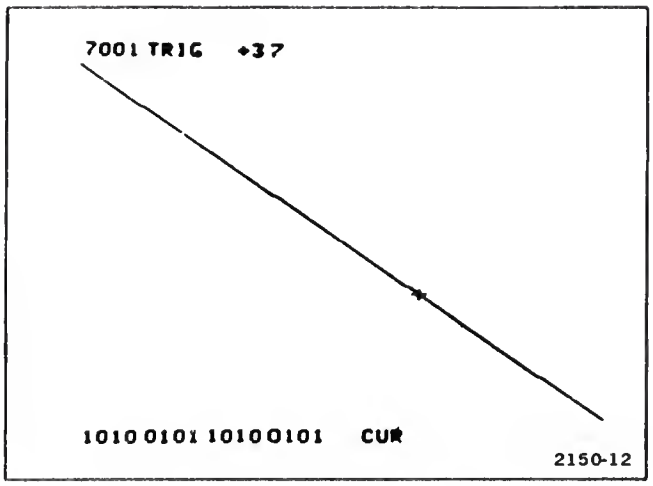

Figure 2-7. Typical map display of 16 channels from the 067-0804-00 Interface Test Fixture.

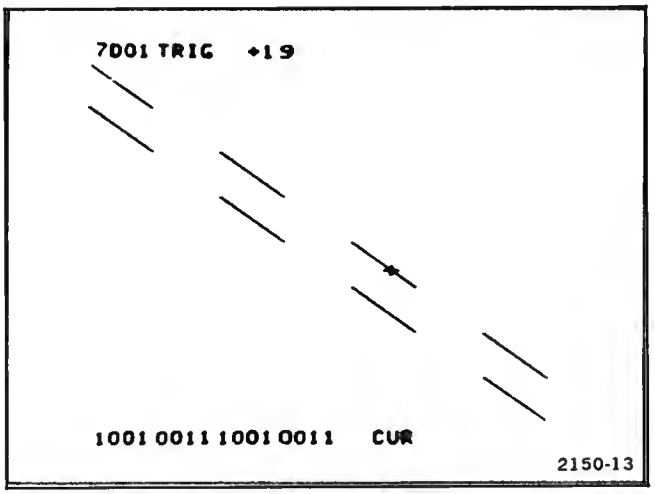

Figure 2-8. Typical map display of 15 channels from the 067-0804-00 Interface Test Fixture (channel 5 input disconnected).

that the trigger-to-cursor readout is +0. Check that the cursor word is blinking and that the trigger word (bottom) is the same as the cursor word. (Ignore the *'s displayed in the bottom two lines of data.)

4. Rotate the 7D01 Cursor Fine Position control counter-clockwise, 1 bit at a time, until the trigger-to-cursor readout is −16. Check that the blinking word is the seventeenth word in the State Table display.

5. Press the STATE TABLE OCTAL push button. Check that the State Table display is given in the octal (base 8) code.

6. Press the STATE TABLE BINARY push button. Check that the State Table display is given in the binary (base 2) code. Press the NEG LOGIC push botton and check that all zeros become ones and that all ones become zeros.

7. Turn off power to the oscilloscope mainframe, wait a short time, and turn power on (Power-On mode). Check crt for Timing Diagram display with trigger-to-cursor readout of zero.

8. Press the STATE TABLE BINARY push button and note the State Table display on the left half of the crt. Press the 7D01 ⊖ INTENS REF push botton and check for a reference state table on the right side of the crt, in addition to the 7D01 state table. Note that the reference state table is all zeros and that the ones in the 7D01 state table are intensified.

9. Press the SEARCH push botton and check that a match of the cursor word in the reference state table (all zeros) is found in the 7D01 memory and transferred to the 7D01 cursor word position (first word in the 7D01 state table). Note that the trigger-to-cursor readout in the 7D01 state table represents the position in memory of the matching word.

10. Set the 7D01 Cursor Position controls for a trigger-to-cursor readout of +0. Press the STORE 7D01→REF push button and check that the 7D01 display is transferred into the reference memory. Note that the trigger-to-cursor readout is +0 for both state tables displayed, and that there are no intensified characters in the 7D01 state table.

11. Press the REF TABLE FOLLOWS 7D01 push button. Rotate the 7D01 Cursor Position controls and check that the trigger-to-cursor readout of the reference state table follows the trigger-to-cursor readout of the 7D01 state table.

12. Press the REF TABLE HELD push button. Rotate the 7D01 Cursor Position controls. Check that the trigger-to-cursor readout in the 7D01 state table changes and the trigger-to-cursor readout in the reference state table remains fixed. Note that intensified bits in the 7D01 state table indicate differences between the displayed state tables.

13. Rotate the 7D01 Cursor Position controls to set the 7D01 trigger-to-cursor readout to +5 and press the REF TABLE FOLLOWS W/OFFSET push button. Rotate the 7D01 Cursor Position controls and check that the

trigger-to-cursor offset between state tables is maintained (offset is obtained in REF TABLE HELD mode).

14. Press the COLUMN BLANK→ push button and check that columns of data are blanked from the State Table displays. The blanked columns are interpreted as "don't care" information for state table comparisons. Press the COLUMN BLANK←push button and check that the blanked columns of data are restored.

15. Press the REF TABLE FOLLOWS 7D01 push button. Check that both state tables have the same trigger-to-cursor readout and that there are no intensified characters in the 7D01 state table. Check that the TABLES= indicator is illuminated.

16. Press the RESET IF TABLES= push button. Check that the state tables are displayed and then reset. The number of resets is displayed below the reference state table. Disconnect channel 0 from the 067-0804-00 Interface Test Fixture. Check that the state tables are not reset and that the number of resets, before the difference, is displayed on the crt. Check that intensified characters in the 7D01 state table are all in the right-hand column (channel 0). Reconnect the channel 0 input to the Interface Test Fixture.

17. Press the RESET IF 7D01=REF push button. Then press the 7D01 Record Manual Reset push button. The 7D01 is reset each time the 7D01 memory and the DF1 reference memory are equal. Check that the number of resets is displayed on the crt readout. Disconnect channel 0 from the 067-0804-00 Interface Test Fixture. Check that both state tables are displayed and that the intensified characters in the 7D01 state table are all in the right-hand column (channel 0). Check that the number of resets, before the difference, is displayed below the reference state table. Reconnect channel 0 to the Interface Test Fixture.

FRONT-PANEL ADJUSTMENTS

1. Perform the Setup Procedure.

2. Rotate the 7D01 Horizontal Position control and note that it horizontally positions the Timing Diagram display. Rotate the 7D01 Horizontal Magnification control and note that it controls the horizontal size of the Timing Diagram display.

3. Rotate the 7D01 Vertical Position control and note that it vertically positions the Timing Diagram display. Rotate the 7D01 Vertical Magnification control and note that it controls the vertical size of the Timing Diagram display.

4. Rotate the DF1 VERT POSN screwdriver adjustment and check that it controls the vertical position of the display readout. Rotate the DF1 VERT SIZE screwdriver adjustment and check that it controls the vertical size of the readout display.

5. Rotate the DF1 HORIZ POSN screwdriver adjustment and check that it horizontally positions the readout displa

6. Rotate the DF1 INTENS CONTRAST screwdriver adjustment and note that it controls the brightness of the readout display.

7. Press the MAP SLOW push button. Rotate the DF1 VERT SIZE screwdriver adjustment and check that it controls the vertical size of the entire Map display. Rotate the DF1 VERT POSN screwdriver adjustment and check that it controls the vertical position of the entire Map display.

8. Rotate the DF1 HORIZ POSN screwdriver adjustment and check that it horizontally positions the entire Map display.

9. Rotate the DF1 INTENS CONTRAST screwdriver adjustment and note that it controls the brightness of the readout display.

10. Press the STATE TABLE BINARY and 7D01 ⊙ INTEN REF push buttons. Rotate the DF1 VERT SIZE screwdriver adjustment and note that it controls the vertical size of the entire State Table display. Rotate the DF1 VERT POSN screwdriver adjustment and note that it vertically positions the entire State Table display.

11. Rotate the DF1 HORIZ POSN screwdriver adjustment and check that it horizontally positions the entire State Table display.

12. Rotate the DF1 INTENS CONTRAST screwdriver adjustment and check that it controls the brightness of the intensified characters in the 7D01 State Table display.

NOTE

The Functional Check procedure is provided for familiarization and for checking basic functions of the DF1 Display Formatter. These functions are checked without removing the covers or making internal connections. Performance requirements, functions which require removal of side panels, and detailed checks of the DF1 memory are provided in the Performance Check and Adjustment procedures in the DF1 Instruction Manual. Only qualified service personnel should perform checks given in the Instruction Manual.

THEORY OF OPERATION

The functions of the DF1 are controlled by a microprocessor system built into the instrument. Data and control functions are transferred within the DF1 by an 8-bit data bus and a 16-bit address bus. The microprocessor acquires data from the associated 7D01 Logic Analyzer and performs the functions indicated by the push buttons on the DF1 front panel. The various output displays are coupled back through the 7D01 to the oscilloscope mainframe. Due to the complexity of the DF1 circuitry (especially the microprocessor) normal troubleshooting techniques may not apply to this instrument. See the Maintenance section of this manual for Troubleshooting procedures.

The following descriptions refer to the functional blocks shown on the schematic diagrams in the back of this manual.

FRONT PANEL ①

The desired function of the DF1 is selected by pressing one of the front-panel switches. When one of the switches is pressed, one of the keyboard lines ($\overline{\text{KYBD 1}}$ - $\overline{\text{KYBD 4}}$) drops to a LO level.

The microprocessor must then determine which switch is being pressed. The keyboard line which is being held LO indicates the proper switch column. The row is indicated by clocking a HI level through shift register U65 until the keyboard line returns to a HI level. The shift register is then cleared (all outputs LO). This procedure is repeated five times to eliminate any contact bounce.

EXAMPLE: If the OCTAL button is pressed, KYBD 2 line will go LO. The outputs of U65 are then sequentially driven HI until KYBD 2 goes HI. This occurs on the third clock pulse, identifying the OCTAL switch.

DATA ACQUISITION ②

The circuitry shown on the Data Acquisition diagram acquires data, cursor, and status information from the 7D01, and connects the keyboard information ($\overline{\text{KYBD 1}}$ - $\overline{\text{KYBD 4}}$) to the Data Bus.

Address Decoder

The Address Decoder, U102, provides a single line output for each of eight addresses. Table 3-1 is a truth table for the Data Acquisition Address Decoder.

TABLE 3-1
Data Acquisition Address Decoder

Inputs					Outputs[2]
A0	A1	A2	A3	$\overline{\text{HZP}}$[1]	
LO	LO	LO	LO	LO	$\overline{\text{00B0}}$
HI	LO	LO	LO	LO	$\overline{\text{00B1}}$
LO	HI	LO	LO	LO	$\overline{\text{00B2}}$
HI	LO	HI	LO	LO	$\overline{\text{00B5}}$
LO	HI	HI	LO	LO	$\overline{\text{00B6}}$
HI	HI	HI	LO	LO	$\overline{\text{00B7}}$

[1] Hi Zero Page.
[2] Outputs change state on rising edge of ϕ_2L signal.

7D01 Cursor Acquisition

The cursor position count is received by the DF1 as ten bits of parallel data. This data is converted to serial data by U132 and U138 and is then clocked through U162 (1D to 1Q) to DB0 (Data Bus line 0).

7D01 Status Acquisition

The operating mode of the 7D01 (store or display) is used by the DF1 to ensure the validity of the acquired data. If the 7D01 goes into store mode while the DF1 is acquiring data, the data acquired would not be valid. The 2Q and 3Q outputs of U162 indicate the status of the 7D01.

Keyboard Latch

The Keyboard Latch, U172, connects the keyboard signal lines ($\overline{\text{KYBD 1}}$ - $\overline{\text{KYBD 4}}$) to the data bus (DB4 - DB7).

7D01 Data Acquisition

Data stored by the 7D01 is transferred to the DF1 and stored for faster access by the microprocessor. The data is transferred in serial form and is connected to DB4 (Data Bus line 4) through input 1D and output 1Q of U182.

The frame pulse indicates the beginning of the serial data. When the frame pulse clocks the Q output of U158B LO, the microprocessor starts clocking in the serial data, one bit at a time, by addressing ØØB1 to pulse the Display Clock Off line LO for each bit of data.

MPU, PROGRAM, AND DATA STORAGE ③

This diagram shows the microprocessor, the program ROM (Read Only Memory), and the data-storage and scratch-pad RAMs (Random Access Memories).

Microprocessor

The microprocessor, U264, is the heart of the DF1. All other stages of the circuitry either provide or accept data and/or instructions for (or from) the microprocessor. Due to the complexity of the microprocessor operation, a description of the microprocessor will not be attempted in this manual. If detailed information is needed, refer to the microprocessor manufacturer's specification books.

Program ROM

The Program ROM (Read Only Memory), U284 and U294, provides the permanent storage for the microprocessor instructions. When the microprocessor addresses a location in the Program ROM, the Program ROM connects the addressed information to the Data Bus, which the microprocessor reads and acts on.

Scratch-Pad RAM

The Scratch-Pad RAM (Random Access Memory), U274, provides temporary storage of data or addresses for the microprocessor. The Scratch-Pad RAM can store up to 128 eight-bit bytes of information.

Data Storage RAM

The Data Storage RAM consists of eight RAMs and three Bus Driver integrated circuits. Drivers U304 and half of U308 buffer the address lines to the RAMs. U354 and the other half of U308 provide buffered 3-state outputs for the RAMs to drive the data bus.

VERT AND HORIZ DISPLAY OUTPUT ④

The Vertical and Horizontal Display Output circuits provide the X-axis and Y-axis deflection for each dot of the State Table or Map displays.

The State Table display consists of 32 columns and 19 rows of characters. Each character contains 5 columns and 7 rows of dots. The State Table display is presented in the following manner: The top row of information (cursor position) is written first. The bottom row of information (trigger word) is written next. The rest of the display is then written, starting with the first row of data and working down. Each row of the display is written from left to right on the crt.

The characters are each written by starting at the top left corner of the character and proceeding across the character to the right edge, then returning to the left edge and dropping to the next row of the character.

The Map display consists of 256 columns and 256 rows of possible dot locations.

Display Column Counter

The Display Column Counter sets the horizontal position of each character of the State Table display. Counter U402 provides the column number (1 to 16) to the ROM, U422. The output of U422 determines the horizontal spacing of the characters. The other 16 columns (columns 17 through 32) are spaced the same as columns 1 through 16, except that they are offset to the right half of the crt display by the HI level at the Q output of U404B. The three-bit or four-bit byte spacing is determined by the level at the E address input of U422. When the E address input is LO, 4-bit byte spacing is provided by the ROM. When the E address line is HI, the other half of the ROM is addressed, providing 3-bit bytes.

Character Column Counter

Character Column Counter U412 provides the horizontal spacing of the five columns of dots for each character. The output of U412 is added to the output of U422 to set the horizontal position of each dot.

Display Row Counter

The Display Row Counter sets the vertical position of each line of the State Table display. Counter U504/U404A provides the row number (1 through 19) to the ROM, U522. The output of U522 determines the vertical spacing of the

rows. Row 1 (cursor location) is written at the top of the crt. Row 2 (trigger word) is written at the bottom of the crt. The other 17 rows are written, in order, starting just below row 1.

Character Row Counter

Character Row Counter U502 provides the vertical spacing of the seven rows of dots for each character. The output of U502 is added to the output of U522 to set the vertical position of each dot.

Display Finish Detector

The Display Finish Detector stops the Display Clock signal after completion of the second or ninteenth display row. The State Table display is finished at completion of row ninteen. The Map and Timing Diagram displays require only the information in rows 1 and 2 (top and bottom). The rest of these displays are provided from other sources.

Character and Dot Position Adders

Adders U432 and U434 combine the outputs of the Display and Character Column Counters to drive the Horizontal D-to-A (digital-to-analog) converter. Adders U552 and U554 combine the outputs of the Display and Character Row Counters to drive the Vertical D-to-A converter.

Map Location Latches

The Map Location Latches accept data directly from the microprocessor, via the Data Bus, to asign dot positions for the Map display. These latches are enabled when the DF1 is in the Map mode.

Map Display Multiplexer

The Map Display Multiplexer selects either State Table or Map display. When the State Table display is selected, the outputs from the adders are coupled through to the Horizontal and Vertical D-to-A converters.

When the Map display is selected, the first two lines (top and bottom) of the State Table are displayed, then the Map Display Multiplexer switches to the Map Location Latch outputs for the remainder of the display.

Vert and Horiz D-to-A Converter

The Digital-to-Analog converters, U468 and U568, each convert eight lines of digital data input to one line of analog data output. The output of each converter is amplified and connected as a push-pull signal to the Vertical or Horizontal outputs to drive the mainframe.

CHARACTER MEMORY AND GENERATOR ⑤

The Character Memory and Generator circuitry provides the Z-axis (intensity) control for the display.

Next Character Row Counter

The Next Character Row Counter provides the number of the next row of the character being displayed.

Character Latch Decoder

The Character Latch Decoder provides the signals to clock the character address information into U674 and U676.

Next Character Counter

The Next Character Counter provides the address for the next character to be displayed.

RAM Address Switch

The RAM Address Switch allows the Character RAM to be addressed by either the microprocessor (to load the RAM) or by the Next Character Counter (for display).

Character RAM

The Character RAM stores the data required to display each character (as supplied by the microprocessor). The data is then fed to the Present Character Latch one character at a time.

Present Character Latch

The Present Character Latch holds the data from the Character RAM while it is being used. Once this information is latched, the Next Character Counter advances to the address of the next character to be displayed. This "pipeline" effect increases the speed of the display by effectively reducing the access time of the Character RAM to zero.

Present Character Generator and Shift Register

The Present Character Generator, U684, provides five outputs, one for each character column. The five outputs indicate whether the corresponding dots are bright or dark. The five outputs from U684 are loaded into Shift Register U694 and clocked out in sequence to provide the Z-axis (intensity) information for each row of each character.

DISPLAY CONTROL AND Z-AXIS ⑥

The circuits on this diagram provide the clock and control signals for the display.

65-Hz Clock

The 65-Hz Clock, U640, provides the "refresh" timing for the display.

Blinking Character Counter

The Blinking Character Counter, U648, causes the trigger word to blink when it appears in the State Table display by disabling the z-axis every fourth time the trigger word is displayed.

4-MHz Clock

The 4-MHz Clock provides the display clock signal when gated by the Character Dot Detector. Flip-flop U714A and gate U724D ensure a full-width pulse output for the first enabled clock pulse.

Character Dot Detector

The Character Dot Detector speeds up the display by allowing display time only if a dot is to be displayed. If no dot is to be displayed at the present address, the next pulse from the 4-MHz Clock is coupled to the DSPL CLK line to advance the counters (diagrams 4 and 5) to the next address. If a dot is to be displayed, the Character Dot Detector allows one 4-MHz Clock pulse for the D-to-A converters (diagram 4) to settle, then enables the Z-axis for two 4-MHz Clock pulses before advancing the counters to the next address.

Map Z-Axis

The Map Z-Axis stage enables the z-axis (intensity) for each dot of the Map display. Monostable multivibrator U748A is triggered by the output of U714B to allow the D-to-A converters (diagram 4) to settle. U748B then enables the z-axis to display each dot.

Display Control

The Display Control stage determines the source of the display and readout signals. The readout source is selected by jumper P754. When the jumper is in the MFR (mainframe readout) position, the cursor position and cursor word readout is supplied by the 7D01 in the Timing Diagram mode (the DF1 provides the readout for the other display modes). When the jumper is in the FOR R (formatter readout) position, the DF1 provides the readout for all display modes.

All display information is supplied by the DF1, except for the Timing Diagram display which is provided by the 7D01 directly.

Output Buffers

The Output Buffers provide the final amplification required by the control signals used by the oscilloscope mainframe.

DISPLAY ⑦

The Display diagram shows the three shift registers and associated emitter followers and LED's which make up the front-panel lighting for the DF1.

MAINTENANCE

This section of the manual contains information for performing preventive maintenance, troubleshooting, and corrective maintenance.

PREVENTIVE MAINTENANCE

Preventive maintenance consists of cleaning, visual inspection, etc. Preventive maintenance performed on a regular basis may prevent instrument breakdown and will improve the reliability of the instrument. The severity of the environment to which the instrument is subjected determines the frequency of maintenance. A convenient time to perform preventive maintenance is preceding adjustment of the instrument.

CLEANING

The instrument should be cleaned as often as operating conditions require. Accumulation of dirt on components acts as an insulating blanket and prevents efficient heat dissipation which can cause overheating and component breakdown.

CAUTION

Avoid the use of chemical cleaning agents which might damage the plastics used in this instrument. Use a non-residue type of cleaner, preferably isopropyl alcohol, total denatured ethyl alcohol, or TP35. Before using any other type of cleaner, consult your local Tektronix Service Center or representative.

Exterior

Loose dust accumulated on the front panel can be removed with a soft cloth dampened in a mild detergent and water solution. Abrasive cleaners should not be used.

Interior

Dust in the interior of the instrument should be removed occasionally due to its electrical conductivity under high-humidity conditions. The best way to clean the interior is to blow off the accumulated dust with dry, low-pressure air.

Remove any dirt which remains with a soft brush or a cloth dampened with a mild detergent and water solution. A cotton-tipped applicator is useful for cleaning in narrow spaces.

VISUAL INSPECTION

The instrument should be inspected occasionally for such defects as broken connections, improperly seated semiconductors, damaged circuit boards, and heat-damaged parts.

The corrective procedure for most visible defects is obvious; however, particular care must be taken if heat-damaged components are found. Overheating usually indicates other trouble in the instrument; therefore, it is important that the cause of overheating be corrected to prevent recurrence of the damage.

Switch Contacts

Switch contacts and pads are designed to operate without lubrication for the life of the switch. However, as the switches are not sealed, dust attracted to the contact area may cause the switch contacts to become electrically noisy. Cleaning may be accomplished by flushing the contact area with isopropyl alcohol or kelite (1 part kelite to 20 parts water). Do not use chemical cleaning agents that leave a film or that might damage plastic parts. Do not use cotton swabs or similar applicators to apply cleaning agents, as they tend to snag and leave strands of cotton on the switch contacts. Should it become necessary to remove a switch for replacement or cleaning refer to Component Removal and Replacement in this section.

SEMICONDUCTOR CHECKS

Periodic checks of semiconductors in the instrument are not recommended. The best check of semiconductor performance is actual operation in the instrument. More details on checking semiconductor operation are given under Troubleshooting.

TROUBLESHOOTING

The following information is provided to help you troubleshoot the instrument. Information contained in other sections of the manual should be used along with the following information to aid in locating the defective component. An understanding of the circuit operation is very helpful in locating troubles, particularly where integrated circuits are used.

TROUBLESHOOTING AIDS

Diagrams

Complete schematic diagrams are given on the foldout pages in section 8, Diagrams and Circuit Board Illustrations. The component number and electrical value of each component in this instrument are shown on these diagrams. (See the first page of the Diagrams and Circuit Board Illustrations section for definitions of the reference designators and symbols used to identify components in this instrument.) Important waveforms, and the numbered test points where they were obtained, are located adjacent to each diagram. The portions of circuits mounted on circuit boards are enclosed with heavy, solid-black lines.

Circuit Board Illustrations

To aid in locating circuit boards, a circuit board location illustration appears on the back of the foldout page facing the schematic diagram. In addition, an illustration of the circuit board(s) is included here, with the physical location of the components and waveform test points that appear on the schematic diagram identified. Each circuit board illustration is arranged in a grid locator with an index to facilitate rapid location of components contained in the schematic diagrams.

Troubleshooting Chart

A troubleshooting chart is given in section 8, Diagrams and Circuit Board Illustrations, to aid in locating a defective circuit. Circuit operation is discussed in detail in section 3, Theory of Operation.

Error Messages on Crt

Table 4-1 indicates the action to be taken in the event an error message is displayed on the crt.

TROUBLESHOOTING EQUIPMENT

The following equipment, in addition to that listed in the Performance Check and Adjustment section, is useful for troubleshooting this unit.

System Test Fixture

Description: Effectively replaces microprocessor U264, and allows operator control of the DF1's data bus, address bus, and R/W line. Tektronix Part 067-0746-00.

TABLE 4-1

Error Messages and Responses

Error Message	Action
SEE MANUAL CUR CAN'T MOVE	1. Check that 7D01 cursor position switch (both fine and course) is firmly seated in detent.
	2. Check DF1 and 7D01 cursor circuitry.
	3. Contact your local Tektronix Field Office or representative for factory repair.
SEE MANUAL BAD RAM	1. Check RAMs U314, U316, U318, U320, U334, U336, U338, and U340, or associated circuitry (see Data Bus and RAM Test in this section). Refer to diagram 3 in section 8.
	2. Contact your local Tektronix Field Office or representative for factory repair.

Interface Test Fixture

Description: Serves as a buffer between the System Test Fixture (067-0746-00) and the DF1. Tektronix Part 067-0804-00.

Cable Extender

Description: Allows the DF1 to operate remote from the 7D01 plug-in unit. Tektronix Part 067-0805-00.

Power Supply

Description: Dc voltage supply; voltage +5 volts, within 5%, with a current capability of at least 1 ampere. Recommended TEKTRONIX types: PS501, PS502, or PS505 Power Supplies.

Transistor Tester

Description: Dynamic-type tester. Purpose: Test semiconductors. Recommended TEKTRONIX types: 576 Curve Tracer, 577/177 Curve Tracer system, 7CT1N Curve Tracer unit and a 7000-series oscilloscope, or a 5CT1N Curve Tracer unit and a 5000-series oscilloscope.

Multimeter

Description: Voltmeter, 10 megohm input impedance and a range from 0 to at least 50 volts dc; accuracy, within 0.1%. Ohmmeter, 0 to 20 megohms. Test probes should be insulated to prevent accidental shorting. Purpose: Check voltage and resistance.

Test Oscilloscope (Storage Type Preferred)

Description: Frequency response, dc to 100 megahertz minimum; vertical deflection factor, 5 millivolts to 5 volts/division. A 10X, 10 megohm voltage probe should be used to reduce circuit loading. Purpose: Check operating waveforms.

Plug-In Extender

Description: Two types of extenders are available. (1) Flexible Plug-In Extender: Tektronix Part 067-0616-00 (two required). (2) Rigid Plug-In Extender: Tektronix Part 067-0589-00 (two required). Purpose: Allows plug-in operation outside the mainframe.

TROUBLESHOOTING TECHNIQUES

Preliminary Troubleshooting Procedure

This preliminary troubleshooting procedure is arranged to check the simple trouble possibilities before proceeding with extensive troubleshooting. The first few checks ensure proper connection, operation, and adjustment. If the trouble is not located by these checks, the remaining steps aid in locating the defective component. When the defective component is located, it should be replaced using the replacement procedure given under Corrective Maintenance.

1. CHECK CONTROL SETTINGS. Incorrect control settings can indicate a trouble that does not exist. If there is any question about the function or operation of any control, see the Functional Check in the Operating Instructions section of this manual.

2. CHECK ASSOCIATED EQUIPMENT. Before proceeding with troubleshooting, check that the equipment used with this instrument is operating correctly. Check that the signal is properly connected and that interconnecting cables are not defective. Also check the power source. If the trouble persists, this instrument is probably at fault.

3. VISUAL CHECK. Visually check that portion of the instrument in which the trouble is located. Many troubles can be located by visible indications such as unsoldered connections, broken wires, damaged circuit boards, damaged components, etc.

4. CHECK INSTRUMENT ADJUSTMENT. This instrument contains only one adjustment; check the adjustment, or the affected circuit if the trouble appears in one circuit. Complete adjustment instructions are given in the Performance Check and Adjustment section.

5. ISOLATE TROUBLE TO A CIRCUIT. To isolate trouble to a circuit, note the trouble symptom. The symptom often identifies the circuit in which the trouble is located. When trouble symptoms appear in more than one circuit, check the affected circuits by taking voltage and waveform readings. Also check for the correct output signals at the front-panel connector with a test oscilloscope. Incorrect operation of all circuits often indicates trouble in the power supply, microprocessor, ROM's, or bus drivers. Check for correct voltages of the individual supplies. A defective component elsewhere in the instrument can appear as a power-supply trouble and may also affect the operation of other circuits.

6. CHECK VOLTAGES AND WAVEFORMS. Often the defective component can be located by checking for the correct voltage or waveform in the circuit.

7. CHECK INDIVIDUAL COMPONENTS. The following procedures describe methods of checking individual components. Two-lead components that are soldered in place are best checked by first disconnecting one end. This isolates the measurement from the effects of surrounding circuitry.

WARNING

To avoid electric shock, disconnect the power source before removing or replacing semiconductors.

Transistors. A good check of transistor operation is actual performance under operating conditions. A transistor can be effectively checked by substituting a new component or one that has been checked previously. However, be sure that circuit conditions are not such that a replacement transistor might also be damaged. If substitute transistors are not available, use a dynamic tester. Static-type testers are not recommended, since they do not check operation under simulated operating conditions.

Integrated Circuits. IC's (integrated circuits) can be checked with a voltmeter, test oscilloscope, or by direct substitution. A good understanding of circuit operation is desirable when troubleshooting circuits using IC's. Use care when checking voltages and waveforms around the IC's so that adjacent leads are not shorted together. A convenient means of clipping a test probe to the 14-, 16-, 20-, and 40-pin IC's is with an IC test clip. This device also serves as an extraction tool. The lead configuration for the semiconductors used in this instrument are shown on a pullout page in the front of the diagrams section.

Diodes. A diode can be checked for an open or shorted condition by measuring the resistance between terminals with an ohmmeter. Use a scale having a low internal source current, such as the R X 1 kΩ scale. The resistance should be very high in one direction and very low when the meter leads are reversed.

CAUTION

Do not use the ohmmeter on a scale that has high internal current. High currents may damage the diode.

The cathode end of each glass-encased diode is indicated by a stripe, a series of stripes, or a dot. The cathode and anode ends of metal-encased diodes are identified by the diode symbol marked on the case.

Resistors. Check resistors with an ohmmeter. See the Replaceable Electrical Parts list for the tolerance of the resistors used in this instrument. Resistors normally do not need to be replaced unless the measured value varies widely from that specified.

Inductors. Check for open inductors by checking continuity with an ohmmeter. Shorted or partially shorted inductors can usually be found by checking the waveform response when high-frequency signals are passed through the circuit. Partial shorting often reduces high-frequency response (roll off).

Capacitors. A leaky or shorted capacitor can usually be detected by checking resistance with an ohmmeter set on its highest scale. Do not exceed the voltage rating of the capacitor. The resistance reading should be high after the initial charge of the capacitor. An open capacitor can best be detected with a capacitance meter or by checking if the capacitor passes ac signals.

8. REPAIR AND ADJUST. If any defective parts are located, follow the replacement procedures given in Corrective Maintenance. Be sure to check the performance of any circuit that has been repaired or had any electrical components replaced.

Troubleshooting with the System Test Fixture

Index to troubleshooting the DF1 with the 067-0746-00 System Test Fixture.

	PAGE
Preliminary Setup Information	4-4
Data Bus and RAM Test	4-6
ROM Test	4-6
Keyboard Test	4-7
Button Lights Test	4-8
Display Test	4-8
7D01 Control Signals	4-10
7D01 Acquisition	4-11
Reset Output	4-13

PRELIMINARY SETUP INFORMATION. Perform the following steps before proceeding to any of the individual procedures.

a. Connect test equipment as shown in Figure 4-1. The Interface Test Fixture is connected to the DF1 Intelligence circuit board as shown in Figure 4-2.

b. Set the System Test Fixture (067-0746-00) control switches (LATCH, FIXTURE, BREAK, INSTR CYCLE) to the Off position.

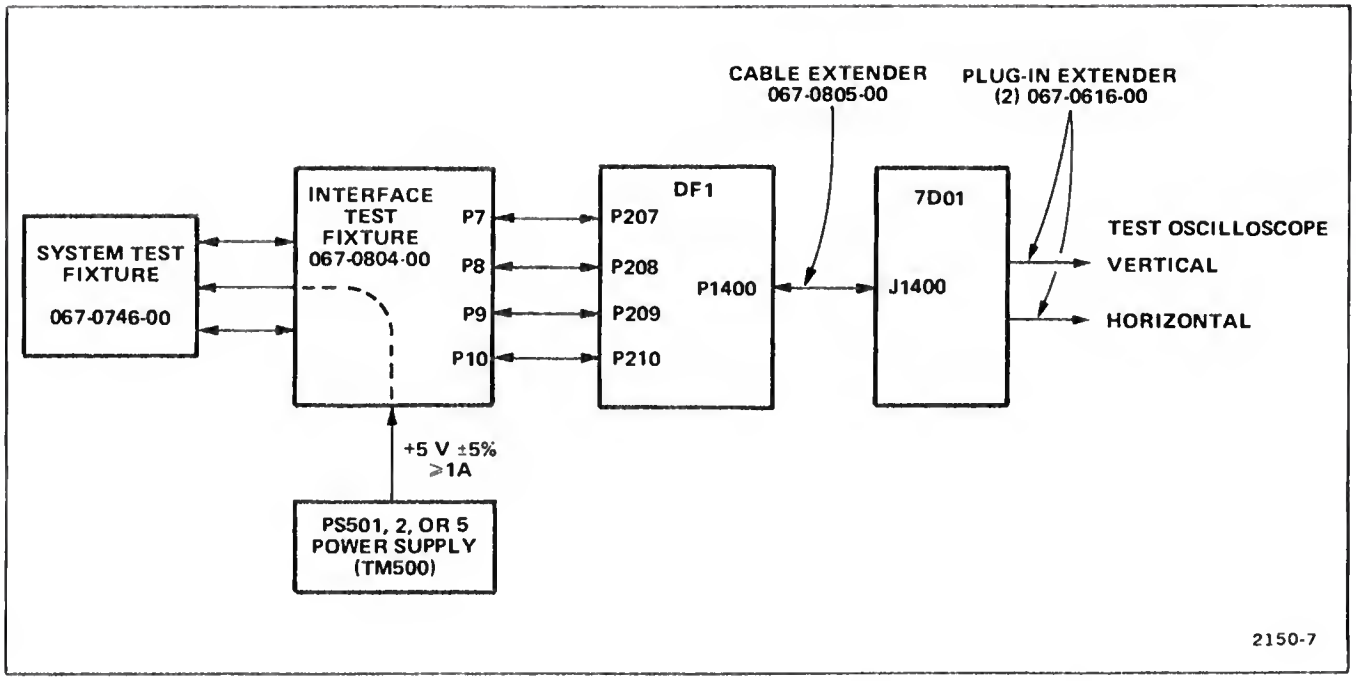

Figure 4-1. Test equipment setup for troubleshooting the DF1 Digital Formatter.

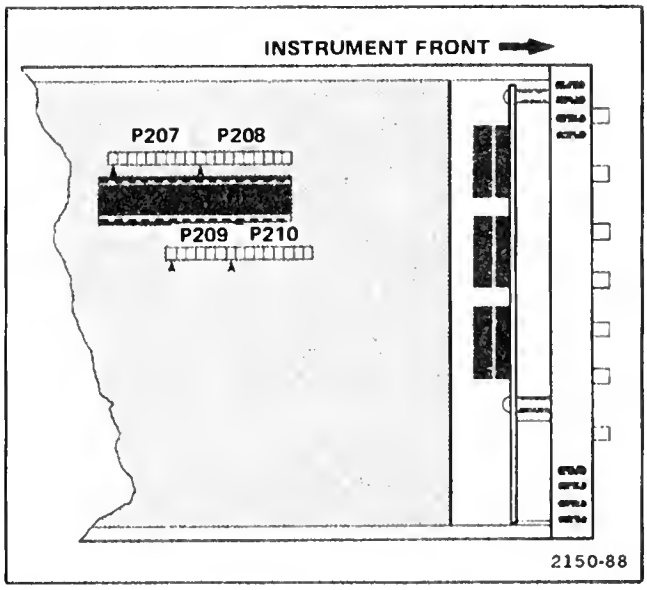

Figure 4-2. Partial view of Intelligence circuit board. Shows pin location and indexing for connection to the Interface Test Fixture.

c. Press the STOP button; the ABA (address bus available) indicator should light. If the ABA indicator does not light, press the RESTART button. If the ABA indicator still does not light, recheck the test equipment setup illustrated in Figure 4-1. Also, check the DF1 clock circuits (01, 02), reset circuit, power supplies, and the Halt line (pin 2 of U264). Check that the BA output (pin 7 of U264) is not excessively loaded or shorted (low). If the ABA indicator does not light, and all the above functions operate properly, either the test fixture or U264 is defective.

d. Once the ABA indicator is on, the 067-0746-00 System Test Fixture is effectively replacing the DF1 microprocessor (U264).

NOTE

The System Test Fixture DATA and ADDRESS switches, and the EXAMINE and DEPOSIT push buttons control the DF1's data bus, address bus, and R/W line. At all times during this troubleshooting procedure, disregard the condition of the Address lights on the System Test Fixture.

e. All references to the setting of the ADDRESS and DATA switches will be in base 16 (hexadecimal) to indicate how each group of 4 switches is set, or each group of 4 lights is read. Refer to Table 4-2 for Hex-to-Binary conversion.

f. In general, if a peripheral does not operate properly on a Deposit or Examine function of one of its addresses, the line that generates that address should be checked (with a logic analyzer or a storage scope) to determine if it is pulsed low. If the line is not pulsed low, the defect will be in either the address coding circuitry or the System Test Fixture.

TABLE 4-2

Hex-to-Binary Conversion

Hex	Binary	Hex	Binary
0	0000	8	1000
1	0001	9	1001
2	0010	A	1010
3	0011	B	1011
4	0100	C	1100
5	0101	D	1101
6	0110	E	1110
7	0111	F	1111

DATA BUS AND RAM TEST. The object of this test is to ensure that the data bus lines are independent of each other, and no other peripheral is controlling the bus.

NOTE

A complete cell-by-cell test of only the Data RAM is executed by the DF1 microprocessor upon Restart. A defective cell is indicated on the crt display as "SEE MANUAL BAD RAM".

The testing method used is to address a RAM cell, write into it (Deposit), then read it (Examine). This is accomplished as follows:

a. Set the System Test Fixture (ADDRESS switches) to correspond to an address in one of the following RAM's.

1. Scratch pad RAM (Hex addresses 0000 through 007F).
2. Data RAM (Hex addresses 6000 through 63FF).

EXAMPLE:

The Scratch pad RAM, Hex address 007F, converted to binary is — 0000 0000 0111 1111. Select the ADDRESS switches on the System Test Fixture to match this address.

b. Set all (except one) of the System Test Fixture DATA switches to 0.

c. Press the DEPOSIT button, then the EXAMINE button, and note how the data lights compare with the switches. The information you have put in the DATA switches should match the Data lights. Continue testing the data buses with a different switch high (1) each time. If, at any point the lights don't agree with the switch positions, check the RAM addressing and support circuits.

d. Set all (except one) of the System Test Fixtures DATA switches to 1. Repeat step c with a different switch set low (0) each time.

NOTE

If at any time the Data lights do not match the DATA switches in steps c and d, the problem is either a bad RAM IC, some other IC on the bus not being disabled, or the buses are either shorted together, to ground, open, or tied to Vcc. A good method to isolate an IC, which is not getting off the bus, is to disconnect the IC's on the data bus, one at a time, until the problem disappears.

ROM TEST. The object of this test is to ensure that the ROM IC's (U284, U294) are being addressed, and that they drive the data bus.

The method is to read (Examine) several addresses in each of the above ROM's and check that the proper output appears on the System Test Fixture Data lights. This is accomplished as follows:

a. Set the System Test Fixture (ADDRESS switches) to correspond to an address of one of the ROM IC's shown in Table 4-3.

EXAMPLE: ROM U284

Hex address F800 converted to binary is — 1111 1000 0000 0000 (refer to Table 4-2). Select the ADDRESS switches on the System Test Fixture to match this address.

b. Press the System Test Fixture EXAMINE button, and note how the Data lights compare with the Data Output listed for that address in Table 4-3.

c. If the Data lights do not match the Data Output listed, the address pins of the IC in question should be checked with a storage type test oscilloscope, or a logic analyzer to determine if:

1. The IC is being enabled (chip selects are correct).
2. The address lines A0-A10 levels correspond to the ADDRESS switch.

If the IC in question passes these last two checks (and the DF1 passed the previous test, Data Bus and RAM Test), substitute the IC with a known good ROM.

TABLE 4-3

ROM Hexadecimal Output Program

ROM U284		ROM U294	
Address	Data Output	Address	Data Output
F800	38	F000	CE
F801	39	F001	00
F802	8D	F002	00
F804	86	F004	00
F808	26	F008	7F
F810	10	F010	55
F820	39	F020	26
F840	97	F040	25
F880	F0	F080	C1
F900	13	F100	DF
FA00	73	F200	97
FC00	84	F400	5C

KEYBOARD TEST. The object of this test is to check for proper operation of the Keyboard circuit.

NOTE

A failure could originate in the Keyboard circuit IC's (U65, U172), the address decoding for them, or the interconnections on one of the specific push buttons used in the test.

If a specific push button switch appears to malfunction, first review the Detailed Operating Instructions (in section 2 of this manual). This will confirm the normal operation for that switch in a particular mode. If the malfunction persists, and the problem is not a defective switch or dirty contacts, proceed to the Keyboard Circuit Checkout Procedure in Table 4-4.

The Keyboard Circuit Checkout Procedure (Table 4-4) checks the operation of a shift register. Therefore, the procedural steps must be performed in the exact sequence listed. An operator error incurred during the performance of this procedure invalidates the sequence, and step 1 of the Keyboard Circuit Checkout Procedure must be started again.

TABLE 4-4

Keyboard Circuit Checkout Procedure

Step	System Test Fixture		Comment
	Address	Data Light Display[1]	
1	00B6	XX[2]	Clears U65. No check; proceed to step 2.
2	Hold down TIMING DIAGRAM button on DF1.		
3	00B0	EX[2]	Reads a Kybd 1 key down.[3]
4	00B0	FX[2]	Reads TIMING DIAGRAM key.
5	Hold down OCTAL button on DF1.		
6	00B0	DX[2]	Reads a Kybd 2 key down.[3]
7	00B0	FX[2]	Reads OCTAL key down.
8	Hold down COL BLANK ← button on DF1.		
9	00B0	BX[2]	Reads Kybd 3 key down.[3]
10	00B0	FX[2]	Reads ← down.
11	Hold down STORE 7D01 → REF button on DF1.		
12	00B0	7X[2]	Reads Kybd 4 key down.[3]
13	00B0	FX[2]	Reads STORE key down.

[1] The X means "disregard the lights in that part of the display".
[2] Press the System Test Fixture EXAMINE button.
[3] Refer to diagram 1 in the Diagrams and Circuit Board Illustrations section.

BUTTON LIGHTS TEST. The object of this test is to assure that each of the DF1 button lights operate properly.

NOTE

The DF1 SEARCH and STORE 7D01→ REF buttons do not have lights.

The button lights in the DF1 are driven by the outputs of a serial-to-parallel shift register. The System Test Fixture data bus 7 (DATA switch number 7) is the input, and a press of the DEPOSIT button (address 00B2) is the clock of this shift register.

Table 4-5 lists the number of times the DEPOSIT button must be pushed in order to control a given DF1 button light.

TABLE 4-5

Manual Clock Pulses Required To Control Button Lights

Number of Deposits (Clock)	Button Light
1	TIMING DIAGRAM
2	FAST
3	SLOW
4	MANUAL
5	Not Used
6	HEX
7	OCTAL
8	BINARY
9	Not Used
10	7D01 ONLY
11	⊙ INTENS REF
12	TABLES= (Indicator light)
13	POS
14	NEG
15	←
16	→
17	FOLLOWS 7D01
18	HELD
19	FOLLOWS W/OFFSET
20	Not Used
21	7D01=REF
22	TABLES= (button light)

To completely check the button lights, proceed as follows:

a. Set the System Test Fixture DATA switch number 7 HI (1), and the ADDRESS switches for 00B2 (refer to Table 4-2).

b. Press the System Test Fixture DEPOSIT (manual clock) button the required number of times shown in Table 4-5, and note that the specified button light comes on.

NOTE

All button lights that are on at the start of this test will be shifted to the right and down with each press of the Deposit button.

c. Set the System Test Fixture DATA switch number 7 LO (0).

d. Repeat step b and note the button light goes off.

If a button light fails to either turn on or off, check the LED, associated transistor, shift register, or the LED power supply (VR62, CR62, and R62).

DISPLAY TEST. There are four control bits with which the microprocessor controls the display. Two of these are at address 00A8. The other two (at address 0098) are used to control operation when in the 7D01 Timing Diagram mode. Checkout for proper display function is accomplished as follows:

a. Connect the DF1 Readout Source multi-pin jumper (internal) to display the formatter readout (FOR R). Refer to Figure 4-3. Assure that the System Test Fixture ABA indicator light is on. Turn off the oscilloscope power momentarily. This action will load WOM RAM with random data for future display. Disregard the actual data that is displayed in the following checks. It's only purpose is to provide a method to check the mode of operation.

b. Set the System Test Fixture ADDRESS switches to 00A8, and the DATA switches as shown for that address on line 1 of Table 4-6.

c. Press the DEPOSIT button.

d. Set the System Test Fixture ADDRESS switches to 0098, and the DATA switches as shown for that address on line 1 in Table 4-6.

e. Press the DEPOSIT button.

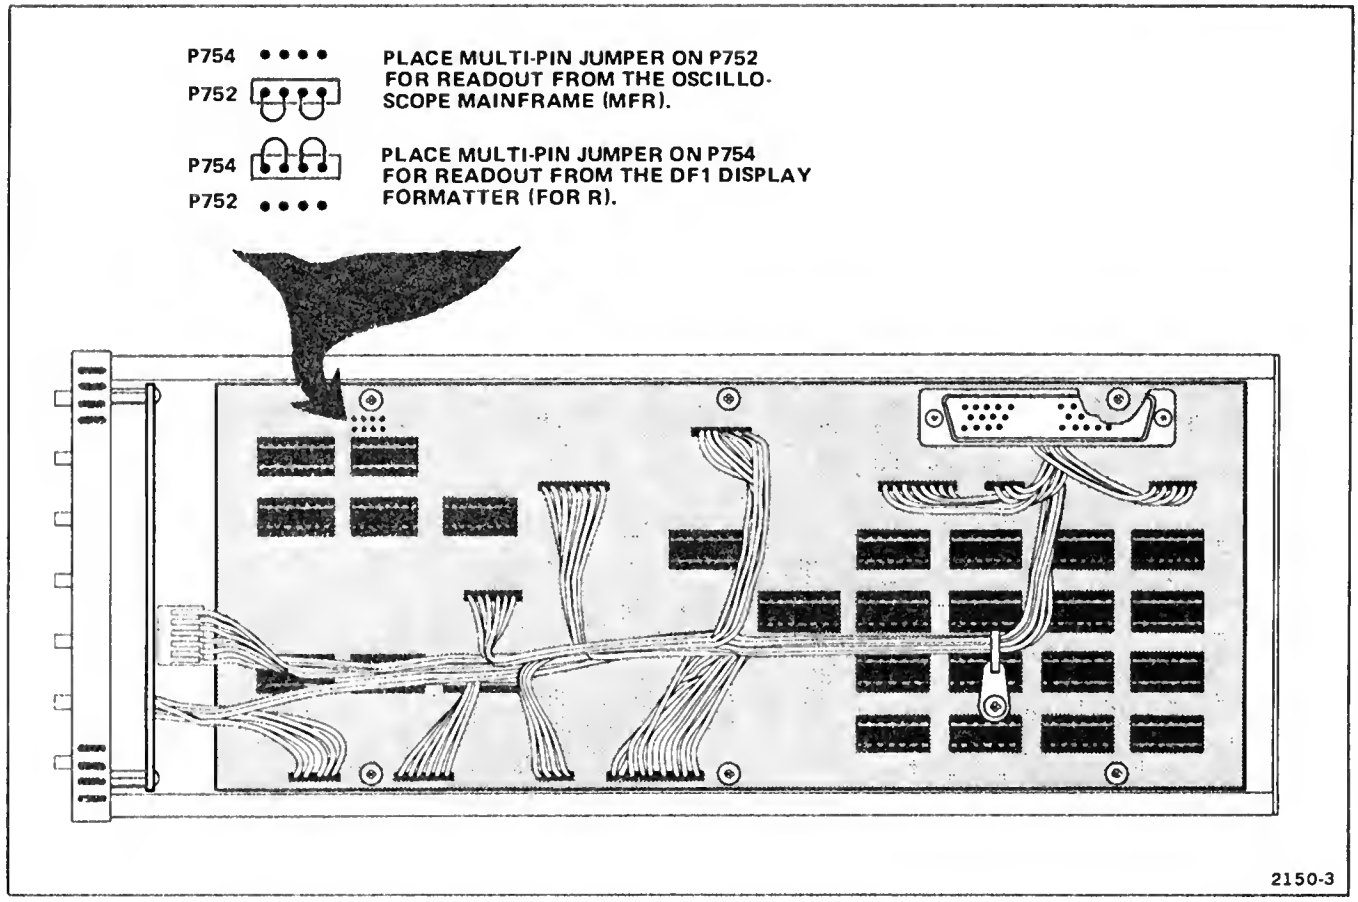

Figure 4-3. Location of readout source multi-pin jumper.

TABLE 4-6

Formatter Readout Truth Table

Line #	Data Switch Number (Address 00A8) 3*	1	0	(Address 0098) 3	0*	Display
1	X	0	0	1	X	Map mode, with 2 lines of DF1 readout. (No map is visible.)
2	1	1	0	1	1	7D01 Timing diagram display with 2 lines of DF1 readout, if triggered.[1]
3	1	1	0	0	1	Display 7D01 timing diagram only — no DF1 readout, if triggered.[1]
4	X	1	1	X	X	Displays 19 lines of DF1 readout.

1 = HI, 0 = LO, X = DON'T CARE

*Control signals necessary only to produce a Timing Diagram display.

[1] If the 7D01 is not triggered, check that 7D01 SAMPLE INTERVAL switch is not in the EXTERNAL position, and press the MANUAL TRIGGER button; verify performance of the 7D01. Check DF1's "7D01 reset" circuit.

f. Check for the proper display (as shown in Table 4-6 for line 1). If the display is correct, repeat the above procedure for lines 2,3, and 4 of Table 4-6.

g. Connect the DF1 Readout Source multi-pin jumper (internal) to display mainframe readout (MFR). Refer to Figure 4-3.

h. Repeat steps b through f, using Table 4-7.

NOTE

If the display does not match that shown in Tables 4-6 and 4-7, first check the mode decoding circuitry, then the display. HINT—If the display doesn't work, follow the counter clocks around to assure they are all operating.

7D01 CONTROL SIGNALS. There are three control lines with which the microprocessor can directly control the 7D01.

Set up conditions as follows:

a. Connect the DF1 Readout Source multi-pin jumper (internal) to display the mainframe readout (MFR). Refer to Figure 4-3.

b. Set the System Test Fixture ADDRESS switches to 0098, and DATA switch number 0 to HI (1).

c. Press the DEPOSIT button.

d. Set the System Test Fixture ADDRESS switches to 00A8. Set DATA switches: number 3 to HI (1), number 1 to HI (1), and number 0 to LO (0).

e. Press the DEPOSIT button.

f. Press the 7D01 manual trigger button.

1. Cursor Increment. Check as follows:

a. Set the System Test Fixture ADDRESS switches for 00B7.

b. Press the EXAMINE button and observe that the cursor display on the crt moves one increment. Check that the cursor moves one increment each time the EXAMINE button is pressed. See note below.

NOTE

If the cursor does not perform properly, check that the 7D01 cursor position switch (both course and fine) are firmly seated in a detent; also check the cursor clock circuitry.

2. Display Clock. Check as follows:

TABLE 4-7

Mainframe Readout Truth Table

Line #	Data Switch Number (Address 00A8) 3*	1	0	(Address 0098) 0	Display
1	X	0	0	0	Map mode, except for 2 lines DF1 readout.
2	X	1	0	0	No 7D01 display or readout.
3	1	1	0	1	Display 7D01 only, with readout, if triggered.[1]
4	X	0	1	X	Not a valid display.
5	X	1	1	0	Displays 19 lines of DF1 readout.

1 = HI, 0 = LO, X = DON'T CARE

*Control signals necessary only to produce a Timing Diagram display.

[1] If the 7D01 is not triggered, verify performance of the 7D01; check DF1's "7D01 reset" circuit; check that 7D01 sample interval switch is not in the external position.

a. Set the System Test Fixture ADDRESS switches to 0098. Set DATA switch number 0 to LO (0).

b. Press the DEPOSIT button. The crt display should disappear.

c. Set the System Test Fixture DATA switch number 0 to HI (1).

d. Press the DEPOSIT button. The crt display should return.

NOTE

Address 0098 determines if the 7D01 display clock is on or off.

3. 7D01 Reset. Check as follows:

a. Set the System Test Fixture ADDRESS switches to 00A8. Set DATA switches: number 1 to HI (1), number 0 to LO (0), and number 3 to LO (0).

b. Press the DEPOSIT button. The 7D01 trig'd light should go out, and the crt display should disappear.

c. Set the System Test Fixture DATA switch number 3 to HI (1).

d. Press the DEPOSIT button.

e. Press the 7D01 manual trigger button. The crt display should return, and the trig'd light should stay on.

NOTE

DATA switch number 3 at address 00A8 controls the 7D01 reset.

7D01 ACQUISITION. Since the DF1's acquisition of the 7D01's data is handled entirely by the microprocessor, this is the most complex interface. Check the Acquiring states of cursor counters, Acquiring 7D01 status, and Acquiring contents of 7D01 memory, as outlined in the following procedures.

Set up conditions as follows:

a. Connect the DF1 Readout Source multi-pin jumper (internal) to display the mainframe readout (MFR). Refer to Figure 4-3.

b. Set the System Test Fixture ADDRESS switches to 0098, and DATA switch number 0 to HI (1).

c. Press the DEPOSIT button.

d. Set the System Test Fixture ADDRESS switches to 00A8. Set the DATA switches: number 3 to HI (1), number 1 to HI (1), and number 0 to LO (0).

e. Press the DEPOSIT button.

f. Press the 7D01 manual trigger button.

1. CURSOR ACQUISITION. Check as follows:

a. Set the 7D01 data channels switch to 0-15 to 0-3.

b. Rotate the 7D01 cursor position switch (fine and course) to position the intensified dot one click before it disappears from the right side of the crt display.

c. Set the System Test Fixture ADDRESS switches to 00B6.

d. Press the EXAMINE button.

e. Set the System Test Fixture ADDRESS switches to 00B0.

f. Press the EXAMINE button 8 times, and observe that the Data light number 0 stays off.

g. Press the EXAMINE button 6 times. Data light number 0 should turn on and remain on.

h. Press the EXAMINE button once, and observe that Data light number 0 turns off.

i. Press the EXAMINE button once, and observe that Data light number 0 turns on again.

j. Rotate the 7D01 cursor position switch (fine) one click (dot disappears from the display).

k. Set the System Test Fixture ADDRESS switches to 00B6.

l. Press the EXAMINE button.

m. Set the System Test Fixture ADDRESS switches to 00B0.

n. Press the Examine button exactly 14 times. The Data bus light number 0 should remain lit through all 14 Examines.

o. Press the EXAMINE button 2 more times. The Data light number 0 should be off both times.

2. 7D01 STATUS. Check as follows:

NOTE

The 7D01 should be in external trigger, with no input.

a. Press the 7D01 manual reset button.

b. Set the System Test Fixture ADDRESS switches to 00B0.

c. Press the EXAMINE button.

d. Check that Data light number 2 is off.

e. Press the 7D01 manual trigger button.

f. Press the EXAMINE button. Observe that Data light number 2 is on.

g. Set the System Test Fixture ADDRESS switches to 00B5.

h. Press the EXAMINE button.

i. Set the System Test Fixture ADDRESS switches to 00B0.

j. Press the EXAMINE button. Observe that Data light number 1 is off.

k. Press the 7D01 manual reset button.

l. Press the 7D01 manual trigger button.

m. Press the EXAMINE button. Observe that Data light number 1 is on.

3. 7D01 Memory. Check as follows:

a. Connect the two P6451 probes (7D01 standard accessories) to the 7D01 connectors.

b. Set the 7D01 front-panel controls as follows:

Threshold Voltage . . . . . .TTL
Sample Interval . . . . . .External
Ext Clock Polarity . . . . . .⌐
Data Channels. 0-15
Data Position . . . . . .Post Trig

c. Connect the P6451 probe test leads as follows:

(1) Both probe ground leads to the Interface Test Fixture ground terminals.

(2) Channel 12 probe lead to terminal 0.

(3) External clock probe lead to terminal C.

d. Press the 7D01 manual reset button.

e. Press the 7D01 manual trigger button (if trig'd light is not on).

f. Set the System Test Fixture ADDRESS switches to 0098. Set DATA switches: number 3 to HI (1), and number 0 to LO (0).

g. Press the DEPOSIT button.

NOTE

If a bright dot appears on the crt display, either position it off-screen, or reduce the oscilloscope intensity.

h. Set the System Test Fixture ADDRESS switches to 00B1.

i. Press the EXAMINE button.

j. Check that Data light number 5 is on, number 6 is on, and number 7 is off.

k. Press the EXAMINE button once. Data light number 4 should change state.

l. Press the EXAMINE button once. Data light number 5 should go off, and Data light number 4 should change state again.

m. Continually press the EXAMINE button. Note that Data light number 5 remains off, light number 6 remains on, and light number 4 changes state with each press of EXAMINE. Stop pressing the EXAMINE button when Data light number 7 comes on (approximately 15-20 Examines).

n. Press the EXAMINE button once more. Check that Data light number 7 is off, and that light number 4 changes state.

RESET OUTPUT. The logic level of the DF1 reset output (RESET OUT jack on DF1 front panel) is the inverse of whatever is deposited into the System Test Fixture DATA switch 1 at address 0098.

CORRECTIVE MAINTENANCE

Corrective maintenance consists of component replacement and instrument repair. Special techniques required to replace components in this instrument are given here.

OBTAINING REPLACEMENT PARTS

All electrical and mechanical part replacements can be obtained through your Tektronix Field Office or representative. However, many of the standard electronic components can be obtained locally in less time than is required to order them from Tektronix, Inc. Before purchasing or ordering replacement parts, check the parts list for value, tolerance, rating, and description.

NOTE

When selecting replacement parts, it is important to remember that the physical size and shape of a component may affect its performance in the instrument, particularly at high frequencies. All parts should be direct replacements unless it is known that a different component will not adversely affect instrument performance.

Some parts are manufactured or selected by Tektronix, Inc. to satisfy particular requirements, or are manufactured for Tektronix, Inc. to our specifications. Most of the mechanical parts used in this instrument have been manufactured by Tektronix, Inc. To determine the manufacturer of parts, refer to parts list, Cross Index Mfg. Code Number to Manufacturer.

When ordering replacement parts from Tektronix, Inc., include the following information:

1. Instrument type.
2. Instrument serial number.
3. A description of the part (if electrical, include circuit number).
4. Tektronix part number.

WARNING

To avoid electric shock, disconnect the instrument from the power source before soldering.

SOLDERING TECHNIQUES

The reliability and accuracy of this instrument can be maintained only if proper soldering techniques are used when repairing or replacing parts. General soldering techniques, which apply to maintenance of any precision electronic equipment, should be used when working on this instrument. Use only 60/40 rosin-core electronic-grade solder. The choice of soldering iron is determined by the repair to be made. When soldering on circuit boards, use a 15- to 25-watt pencil-type soldering iron with a 1/8-inch wide, wedge-shaped tip. Keep the tip properly tinned for best heat transfer to the solder joint. A higher wattage soldering iron may separate the wiring from the base material. Avoid excessive heat; apply only enough heat to remove the component or to make a good solder joint. Also, apply only enough solder to make a firm solder joint; do not apply too much solder.

CAUTION

The Acquisition, Intelligence, and Button Lights circuit boards in this instrument are multilayer type boards with a conductive path(s) laminated between the top and bottom board layers. All soldering on these boards should be done with extreme care to prevent breaking the connections to the center conductor(s); only experienced maintenance personnel should attempt repair of these boards.

For metal terminals, (e.g., coaxial connector, ground lug, etc.) a higher wattage soldering iron may be required. Match the soldering iron to the work being done. For example, if the component is connected to the chassis or other large heat-radiating surface, it will require a 40-watt or larger soldering iron.

The following technique should be used to replace a component on a circuit board:

1. Grip the component lead with long-nose pliers. Touch the soldering iron to the lead at the solder connection. Do not lay the iron directly on the board, as it may damage the board.

2. When the solder begins to melt, gently pull the lead out. If unable to pull the lead out of the circuit board without using force, try removing the other end of the component as it may be more easily removed.

NOTE

The reason that some component leads seem troublesome to remove is due to a bend placed in each lead during the manufacturing process. The purpose of the bent leads is to hold the component in place during a flow-soldering manufacturing process that solders all components at one time.

If a component lead is extremely difficult to remove, it may be helpful to straighten the leads on the back side of the board with a small screwdriver or pliers while heating the soldered connection.

Unsolder the component from the circuit board using heat on the component lead so that the solder will stay behind on the board. If you desire to remove solder from a circuit board hole for easier installation of a new component, use a solder-removing wick.

3. Bend the leads of the new component to fit the holes in the board. If the component is replaced while the board is mounted in the instrument, cut the leads so they will just protrude through the board. Insert the leads into the holes in the board so the component is firmly seated against the board (or as positioned originally). If it does not seat properly, heat the solder and gently press the component into place.

4. Touch the iron to the connection and apply a small amount of solder to make a firm solder joint. To protect heat-sensitive components, hold the lead between the component body and the solder joint with a pair of long-nose pliers or other heat sink.

5. Clip the excess lead that protrudes through the board (if not clipped in step 3).

6. Clean the area around the solder connection with a flux-removing solvent. Be careful not to remove information printed on the board.

COMPONENT REMOVAL AND REPLACEMENT

WARNING

To avoid electric shock, disconnect the instrument from the power source before replacing components.

The exploded-view drawing associated with the Replaceable Mechanical Parts list may be helpful in the removal or disassembly of individual components or subassemblies. Component locations are shown in the Diagrams and Circuit Board Illustrations section.

Circuit Boards

If a circuit board is damaged beyond repair, replace the entire board assembly. Part numbers are given in the Replaceable Electrical Parts list for completely wired boards. Refer to Figure 4-4 for circuit board locations.

A2—BUTTON LIGHTS CIRCUIT BOARD. To remove the circuit board:

1. Position instrument upside down with front panel facing you. Carefully pry front panel away from sub-panel using a small screwdriver in slot provided on sub-panel bottom. Carefully remove front panel.

2. Note colors of the three multi-pin connectors and the P number to which each connects on the two front sub-panel mounted circuit board assemblies.

3. Remove 4 screws (A, B, C, and D on Fig. 4-5) from front sub-panel assembly.

4. Remove 4 screws (A, B, C, and D on Fig. 4-6) from Button Lights circuit board. Carefully lift board away from sub-panel assembly.

5. To replace Button Lights circuit board, reverse order of removal, and snap panel back into position.

A1—FORMATTER KEYBOARD CIRCUIT BOARD. To remove the circuit board:

1. Remove A2—Button Lights circuit board as previously described.

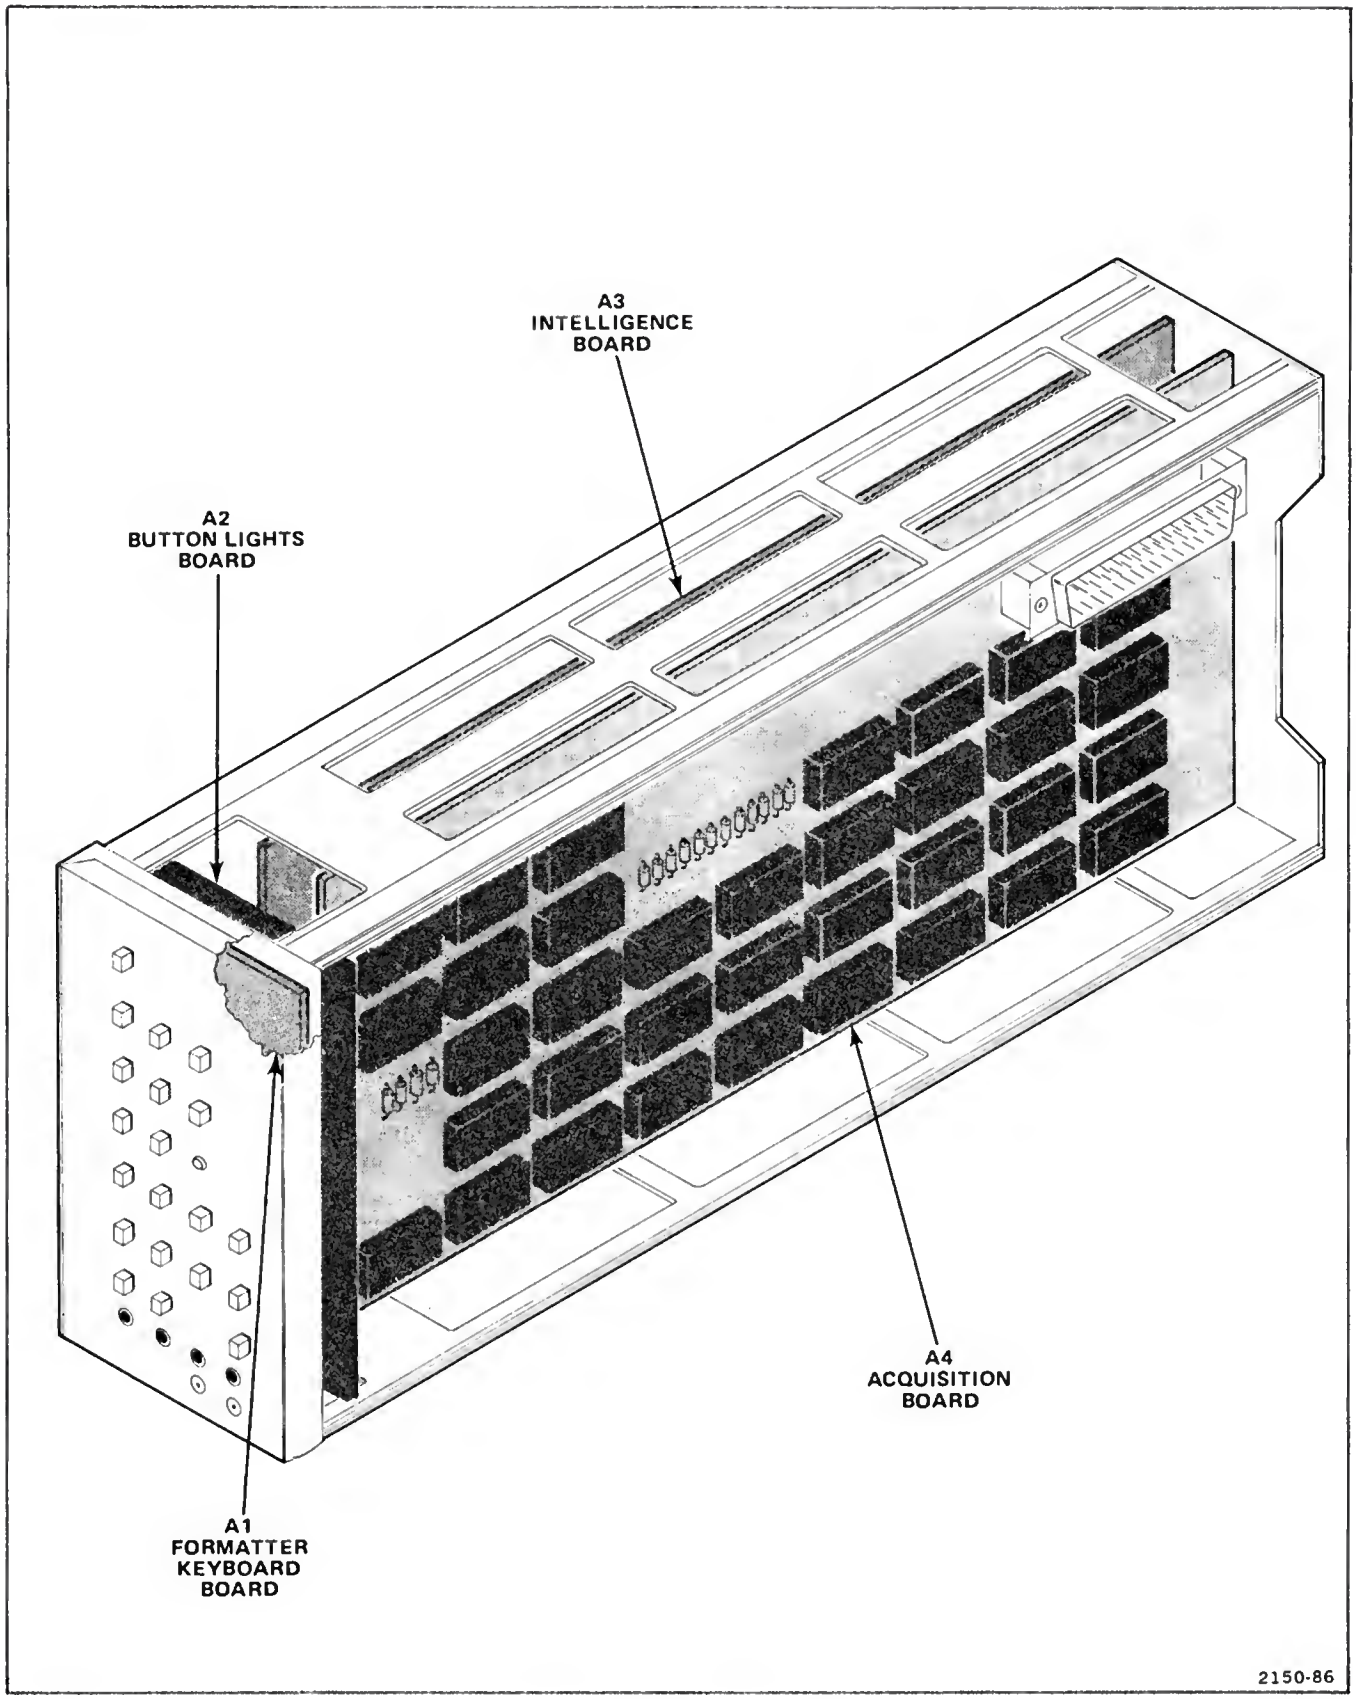

Figure 4-4. Circuit board locations.

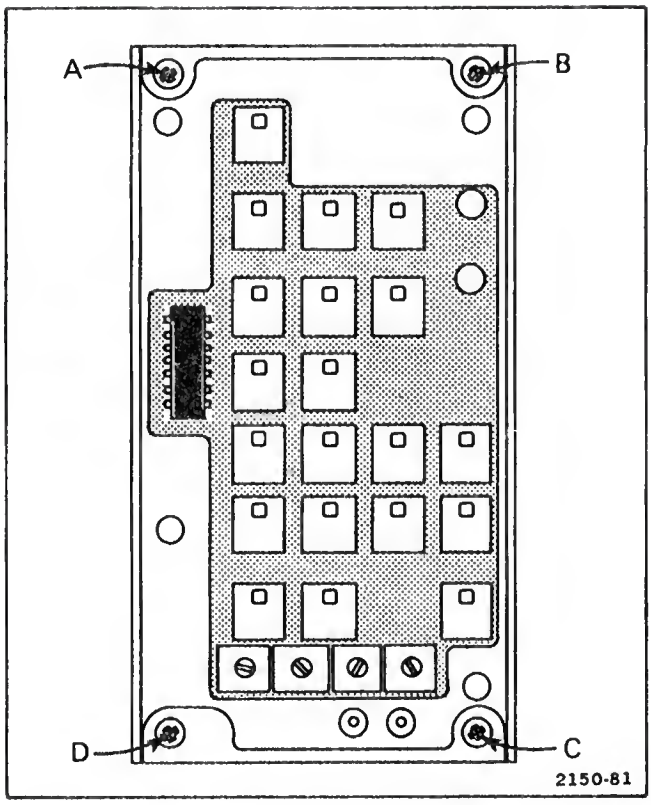

Figure 4-5. Locations of securing screws on the front sub-panel.

2. Disconnect 2 wires (W1 and W2 on Fig. 4-7). Remove 4 hexagonal spacers (A, B, C, and D on Fig. 4-7), and lift board away from front sub-panel.

3. To replace A1–Formatter Keyboard circuit board, reverse order of removal.

A3–INTELLIGENCE CIRCUIT BOARD. To remove the circuit board:

1. Remove 6 screws (A, B, C, D, E, and F on Fig. 4-8).

2. Carefully disengage interconnecting board pins (one row of interconnecting pins at front panel end of board, and one row near rear panel). Lift board clear of instrument between top and bottom frame rails.

3. To replace A3–Intelligence circuit board, reverse order of removal. The use of a small screwdriver may aid in aligning the circuit board connecting pins with their sockets.

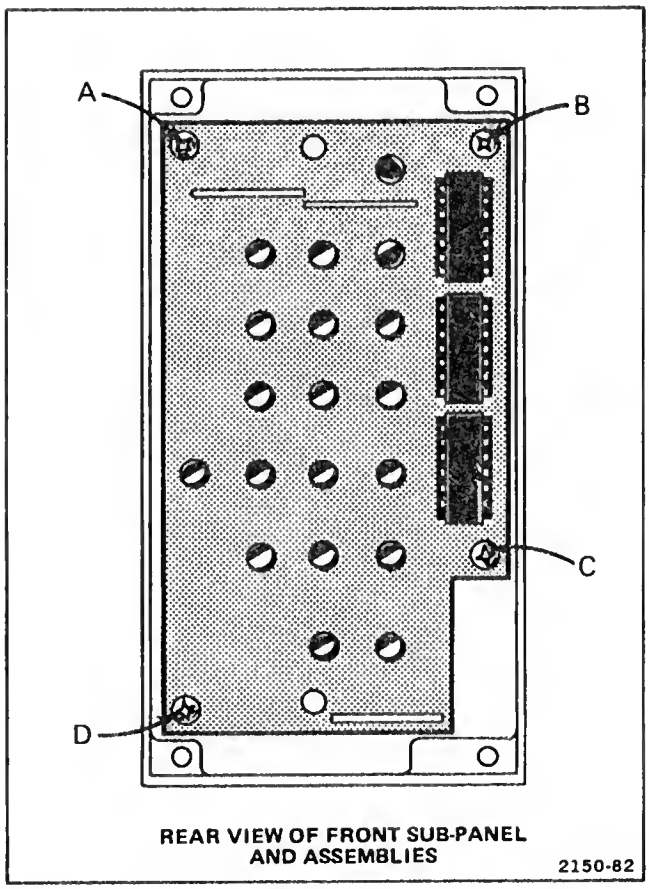

Figure 4-6. Locations of securing screws on A2 Button Lights circuit board.

A4–ACQUISITION CIRCUIT BOARD. To remove the circuit board:

1. Remove 3 screws (A, B, and C on Fig. 4-9).

2. Note color of all multi-pin connectors and the P number to which each connects.

3. Disconnect all cables that terminate on A4–Acquisition circuit board.

4. Remove 6 screws (D, E, F, G, H, and I on A4–Acquisition circuit board).

5. Carefully disengage interconnecting board pins (one row of interconnecting pins at front panel end of board, and one row near rear panel). Lift board clear of instrument between top and bottom frame rails.

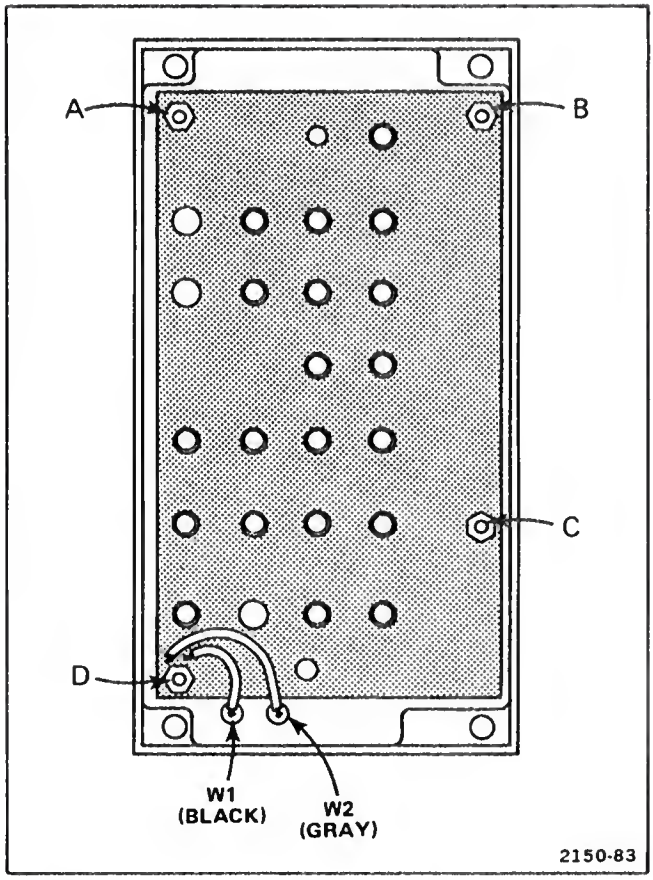

Figure 4-7. Locations of hex securing spacers and wiring to be disconnected on A1 Formatter Keyboard circuit board.

6. To replace A4—Acquisition circuit board, reverse order of removal. The use of a small screwdriver may aid in aligning the circuit board connecting pins with their sockets.

Pushbutton Switches

All the pushbutton switches used in this instrument are mounted on the A1—Formatter Keyboard circuit board. First, remove the A1—Formatter Keyboard circuit board following the procedure given under Circuit Boards in this section. To remove any switch from the board, simply push from the rear of the switch until the two plastic retainers disengage from the board. To replace the switch, align the two plastic retainers with the mating holes in the circuit board and snap into position.

Semiconductors

Semiconductors should not be replaced unless actually defective. If removed from their sockets during routine maintenance, return them to their original sockets. Unnecessary replacement of semiconductors may affect the adjustment of this instrument. When semiconductors are replaced, check the operation of the part of the instrument which may be affected.

WARNING

To avoid electric shock, power must be turned off before removing or replacing semiconductors.

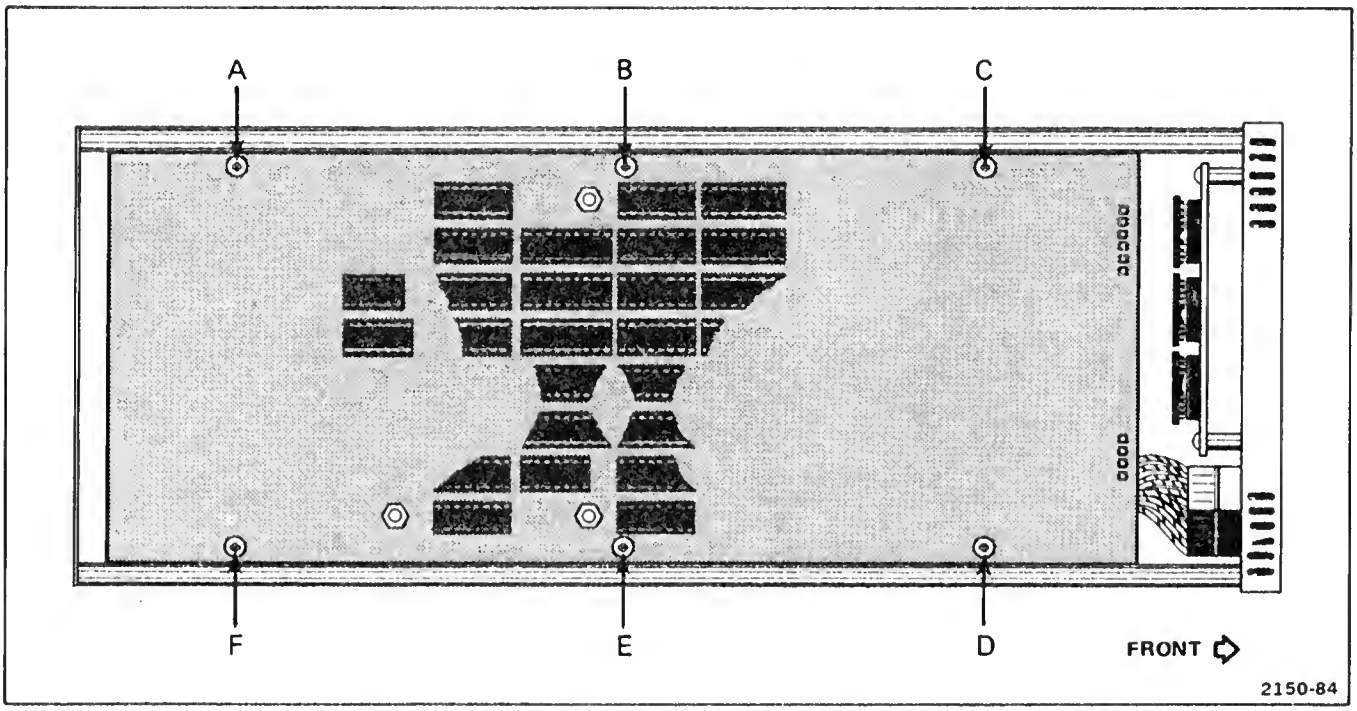

Figure 4-8. Locations of securing screws on A3 Intelligence circuit board.

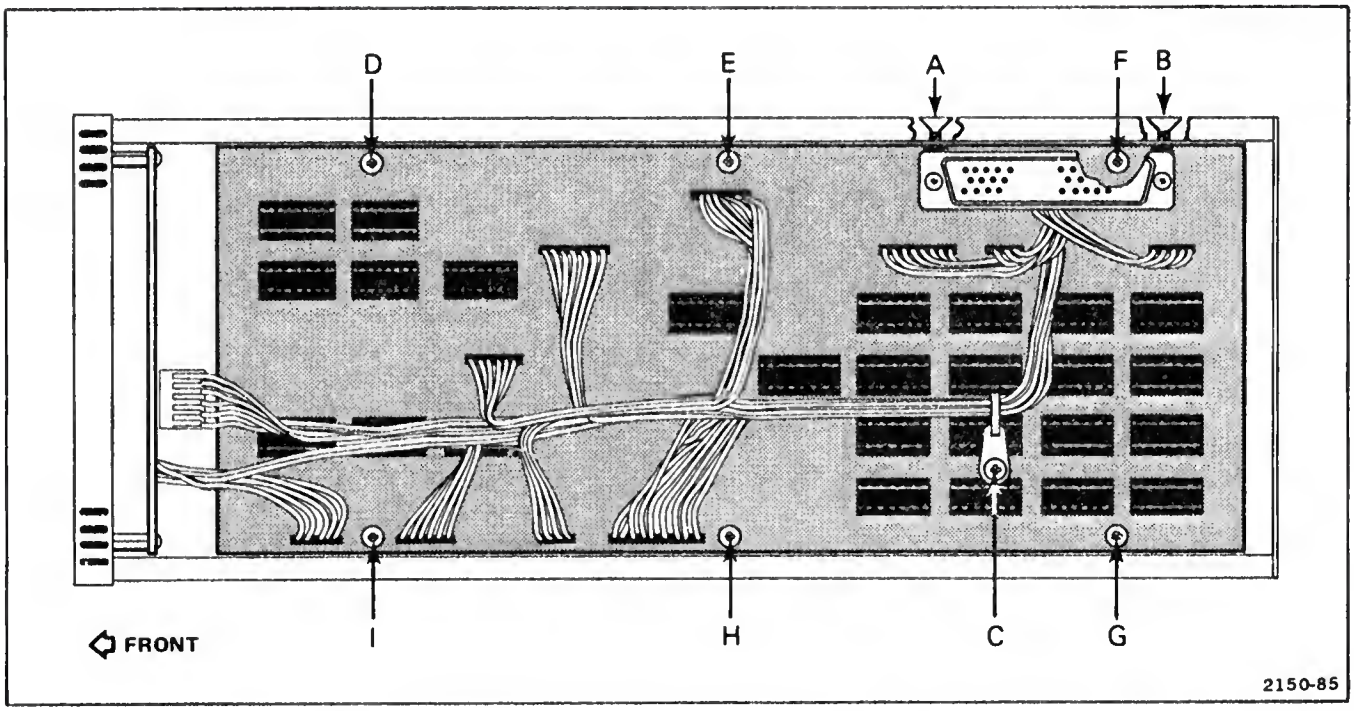

Figure 4-9. Locations of securing screws and hardware mounting screws on A4 Acquisition circuit board.

Replacement devices should be of the original type or a direct replacement. The lead configurations of the semiconductor devices used in this instrument are shown in the Diagrams and Circuit Board Illustrations section. When replacing, check the manufacturer's basing diagram for correct basing.

An extracting tool should be used to remove the 14-, 16-, 20-, and 40-pin integrated circuits to prevent damage to the pins. This tool is available from Tektronix, Inc. Order Tektronix Part 003-0619-00. If an extracting tool is not available when removing one of these integrated circuits, pull slowly and evenly on both ends of the device. Try to avoid having one end of the integrated circuit disengage from the socket before the other, as the pins may be damaged.

Interconnecting Pins

All interconnections in this instrument are made utilizing pins soldered into the board. Two types of mating connectors are used for these interconnecting pins. If the mating connector is mounted on a plug-on circuit board, a special socket is soldered into the board. If the mating connector is on the end of a lead, an end-lead pin connector is used which mates with the interconnecting pin. The following information provides the removal and replacement procedure for the various types of interconnecting methods:

CIRCUIT-BOARD PINS. A circuit-board pin replacement kit (including necessary tools, instructions, and replacement pins with attached ferrules) is available from Tektronix, Inc. Order Tektronix Part 040-0542-00. Replacing circuit-board pins on multi-layer boards is not recommended; refer such repairs to your local Tektronix Field Office or representative.

To replace a damaged pin, first disconnect any pin connectors. Then unsolder (see Soldering Techniques) the damaged pin and pull it from the board with a pair of pliers, leaving the ferrule (see Fig. 4-10) in the circuit board if possible. If the ferrule remains in the circuit board, remove the spare ferrule from the replacement pin and press the new pin into the hole in the circuit board. If the ferrule is removed with the damaged pin, clean out the hole using a solder-removing wick and a scribe. Then press the replacement pin, with attached spare ferrule, into the circuit board. Position the replacement pin in the same manner as the original pin had been. Solder the pin to the circuit board on each side of the board. If the original pin was bent at an angle to mate with a connector, carefully bend the new pin to the same angle. Replace the pin connector.

CIRCUIT-BOARD PIN SOCKETS. The pin sockets on the circuit boards are soldered to the back of the board. To remove or replace one of these sockets, first unsolder the pin (use a vacuum-type desoldering tool to remove excess

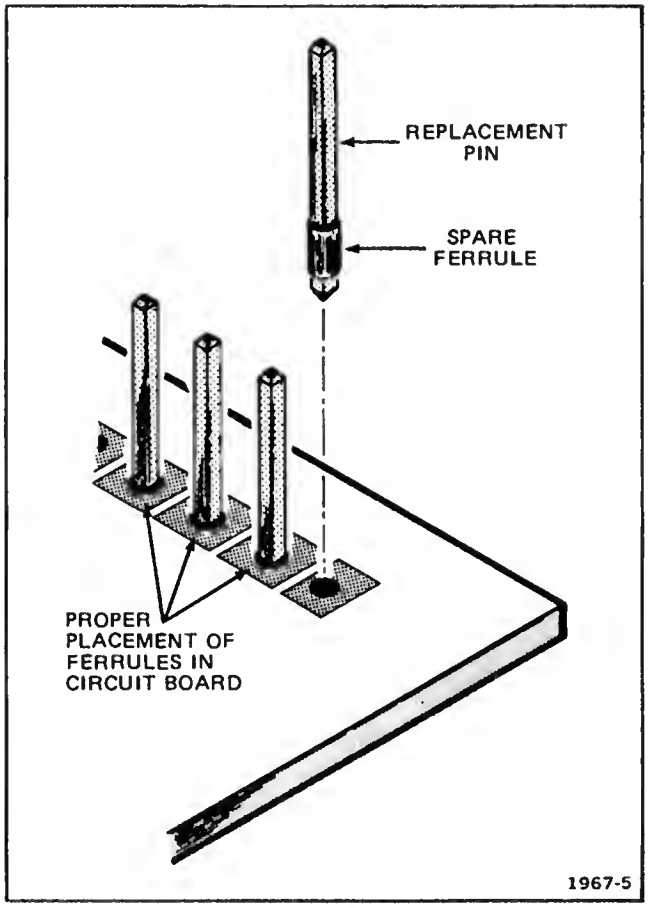

Figure 4-10. Exploded view of circuit-board pin and ferrule.

solder). Then straighten the tabs on the socket and remove the socket from the board. Place the new socket in the circuit board hole and press the tabs down against the board. Solder the tabs of the socket to the circuit board; be careful not to get solder inside the socket.

CAUTION

The spring tension of the pin sockets ensures a good connection between the circuit board and the pin. This spring tension can be destroyed by using the pin sockets as a connecting point for spring-loaded probe tips, alligator clips, etc.

END-LEAD PIN CONNECTORS. The pin connectors used to connect the wires to the interconnecting pins are clamped to the ends of the associated leads. To remove or replace damaged end-lead pin connectors, remove the old pin connector from the end of the lead and clamp the replacement connector to the lead.

Some of the pin connectors are grouped together and mounted in a plastic holder; the overall result is that these connectors are removed and installed as a multi-pin connector (see Troubleshooting Aids). If the individual end-lead pin connectors are removed from the plastic holder, note the order of the individual wires for correct replacement.

ADJUSTMENT AFTER REPAIR

After any electrical component has been replaced, the adjustment of that particular circuit should be checked, as well as other closely related circuits. See Section 5 for a complete Adjustment procedure.

PERFORMANCE CHECK AND ADJUSTMENT

This section provides information necessary to check performance requirements, functions which require removal of side panels, detailed checks of the DF1 memory, and to make internal adjustments. An additional Functional Check procedure, in the Operating Instruction section, checks the functions of the front-panel controls.

PRELIMINARY INFORMATION

Adjustment Interval

To maintain instrument accuracy, check the performance of the DF1 every 1000 hours of operation, or every 6 months if used infrequently. Before complete adjustment, thoroughly clean and inspect this instrument as outlined in section 4, Maintenance.

Tektronix Field Service

Tektronix Field Service Centers and Factory Service Centers provide instrument repair and adjustment services. Contact your Tektronix Field Office or representative for further information.

Performance Check

Performance of this instrument can be checked by performing only the Performance Check. This procedure checks the instrument against the tolerances listed in the Performance Requirement column of the DF1 Specifications, and also checks the DF1 memory. Performance Check Table 5-1 (derived from the Specifications in the General Information section) briefly describes the test method to check the performance requirement for a given characteristic. To completely check all instrument functions, as well as instrument performance, perform the Functional Check (located in the Operating Instructions section) and Performance Check procedures.

Adjustment Procedure

Completion of the Adjustment procedure ensures that the instrument is correctly adjusted. Instrument performance is checked before an adjustment is made.

Partial Procedure

A partial performance check or adjustment may be desired after replacing components or to touch up the adjustment portion of the instrument. Each Performance Check and Adjustment step is written to stand alone. Therefore to perform a partial procedure proceed to the desired numbered step (1, 2, 5, etc.) and follow the procedure.

TABLE 5-1

Performance Check Description

Characteristic	Performance Requirement	Test Method
External Read Clock		
Frequency Range	100 kHz to 500 kHz.	Not Tested.
Duty Cycle	50% within 5%.	Not Tested.
Display		
Vertical Size	Adjustable from 6.9 div, or less, to at least 8.1 div from the top of the first line of DF1 readout to the bottom of the last line of DF1 readout.	Not Tested.
Vertical Position	Adjustable to vertical center of display area in any calibrated 7000-series mainframe.	Not Tested.
Horizontal Position	Adjustable to horizontal center of display area in any calibrated 7000-series mainframe.	Not Tested.

TABLE 5-1 (CONT.)

Performance Check Description

Characteristic	Performance Requirement	Test Method
Output Signals		
Reset Logic Voltage Level	LO: +0.4 V, or less, at 2 mA.	LO tested by connecting 7D01 channel 0 probe and 2 mA source (2.4 kilohm to +5 V) to RESET OUT jack. (7D01 Threshold Voltage set to +0.4 V.)
	HI: at least +2.4 V at 2 mA.	HI tested by connecting 7D01 channel 0 probe and 2 mA drain (1.2 kilohm to gnd.) to RESET OUT jack. (7D01 Threshold Voltage set to +2.4 V.)
Waveshape	Positive-going rectangular pulse.	Checked indirectly above.
Duration	100 μs within 50 μs when used with the 7D01 internal read clock.	Checked by using trigger-to-cursor readout on displayed pulse (1 μs sample interval).

TEST EQUIPMENT REQUIRED

The test equipment listed in Table 5-2 is required for a complete performance check and adjustment of this instrument. The specifications for test equipment, given in Table 5-2, are the minimum required to meet the Performance Requirements. Detailed operating instructions for test equipment are omitted in this procedure. Refer to the test equipment instruction manual if more information is needed.

Special Fixtures

Special fixtures are used only where they facilitate instrument adjustment. These fixtures are available from Tektronix, Inc. Order by part number from Tektronix Field Offices or representatives.

Test Equipment Alternatives

The test equipment listed in the Examples of Applicable Test Equipment column, Table 5-2, is required to check and adjust this instrument. The Performance Check and Adjustment procedure is based on the first item of equipment given as an example. If other equipment is substituted, control settings or setups may need to be altered. If the exact item of equipment given as an example is not available, refer to the Minimum Specifications column to determine if other equipment may be substituted. Then check the Purpose column. If you determine that your measurement requirements will not be affected, the item and corresponding step(s) can be deleted.

TABLE 5-2

Test Equipment

Description	Minimum Specifications	Purpose	Examples of Applicable Test Equipment
1. Oscilloscope mainframe	Tektronix 7000-series with 2 vertical and 1 horizontal plug-in compartments.	Provides display for 7D01 and DF1.	a. TEKTRONIX 7603 Oscilloscope. b. Refer to the TEKTRONIX catalog for a compatible oscilloscope mainframe.
2. Logic Analyzer with Data Acquisition Probes.	Tektronix 7D-series compatible with DF1.	The DF1 is operable only with a companion Logic Analyzer.	a. TEKTRONIX 7D01 Logic Analyzer with two P6451 Data Acquisition Probes.
3. TTL Signal Source	Clock and 8-bit counter. Clock frequency; approximately 1 kilohertz.	Provides standard input signals to 7D01.	a. TEKTRONIX 067-0804-00 TEST FIXTURE. b. Circuit as shown in Figure 5-2.
4. +5-Volt Power Supply	Current; at least 100 mA.	Provides power to TTL Signal Source and provides 2 mA source for Reset Out check.	a. TEKTRONIX PS501 Power Supply with TM500-series Power Module.
5. Voltmeter	Range; +0.4 V to +2.4 V.	Set 7D01 Variable Threshold Voltage during Reset Out check.	a. Triplett 630-NA VOM. b. Simpson 262.

INDEX TO PERFORMANCE CHECK AND ADJUSTMENT

PAGE

PRELIMINARY PROCEDURE 5-3

PERFORMANCE CHECK PROCEDURE

1. Check Trigger Points 5-4
2. Check Old Data 5-5
3. Check Data Acquisition 5-6
4. Check Mainframe Readout 5-6
5. Check Reset Out Pulse 5-7

ADJUSTMENT PROCEDURE

1. Adjust Horizontal Gain 5-8

PRELIMINARY PROCEDURE

1. Before connecting the DF1 Display Formatter to the 7D01 Logic Analyzer, set the 7D01 for "first trigger" operation (see Fig. 5-1), and check that the DF1 is set for Formatter Readout (FOR R).

2. Attach the DF1 to the 7D01 and install the three-wide plug-in assembly into the oscilloscope mainframe (refer to Installation, in the General Information section, for assembly instructions).

3. Connect the Interface Test Fixture to the 7D01 as shown in Figure 5-2.

4. Set the 7D01 Logic Analyzer controls as follows:

Sample Interval . . . . . .Ext
Record Display Time . . . . . .∞
Data Position . . . . . .Post Trig
Data Channels. 0-15
Trigger Source . . . . . .W.R.
Word Recognizer
  Ch 0 through Ch 15 . . . . .Lo
  External Qualifier X
  Probe Qualifier X
  W.R. Mode. . . . . .Sync.
Threshold Voltage . . . . . .TTL (+1.4 V)
Ext Clock Polarity . . . . . ⌐

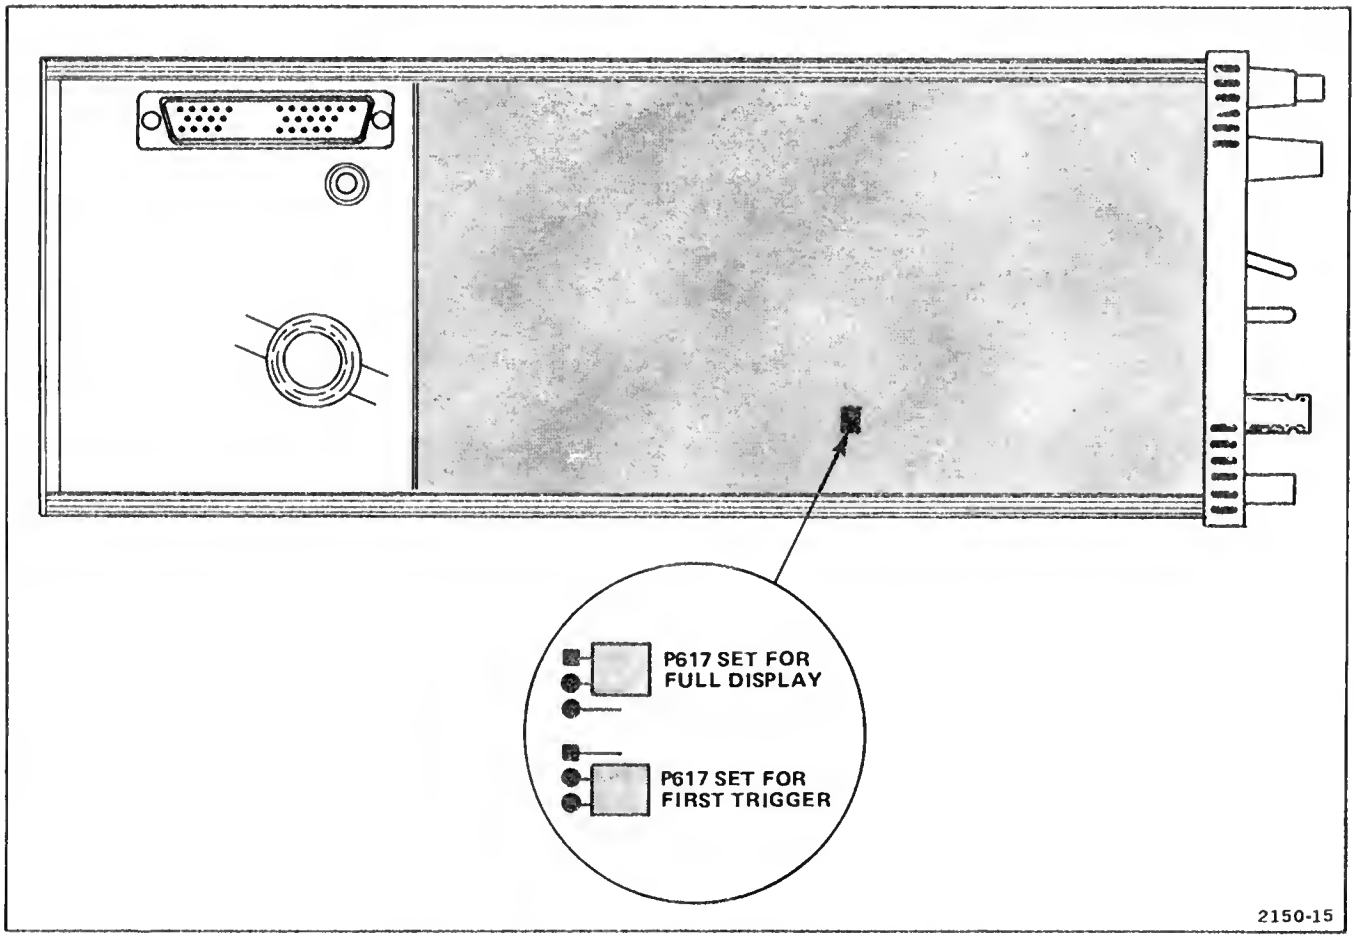

Figure 5-1. Location of 7D01 Full Display/First Trigger jumper.

5. Perform the Power-On function (turn mainframe power off, wait approximately 10 seconds, and turn power on).

PERFORMANCE CHECK PROCEDURE

1. Check Trigger Points

a. Perform the Preliminary Procedure.

b. Adjust mainframe intensity and 7D01 Vert and Horiz controls for a well-defined Timing Diagram display.

c. Check that the trigger-to-cursor readout (top of display) is +0 and the cursor word readout (bottom of display) is 0000 0000 0000 0000 when the trigger and cursor intensified spots are superimposed.

d. Change the 7D01 Data Channels switch to 0-7 position and press the Record Manual Reset push button.

e. Set the 7D01 Cursor position controls to superimpose the cursor tnd trigger intensified spots on the display.

f. Check that the trigger-to-cursor readout is +0 and the cursor word readout is 0000 0000.

g. Change the 7D01 Data Channels switch to 0-3 position and press the Record Manual Reset push button.

h. Set the 7D01 Cursor position controls to superimpose the cursor and trigger intensified spots on the display.

i. Check that the trigger-to-cursor readout is +0 and that the cursor word readout is 0000.

j. Change the 7D01 Data Channels switch to 0-15 position and the Data Position switch to Center position.

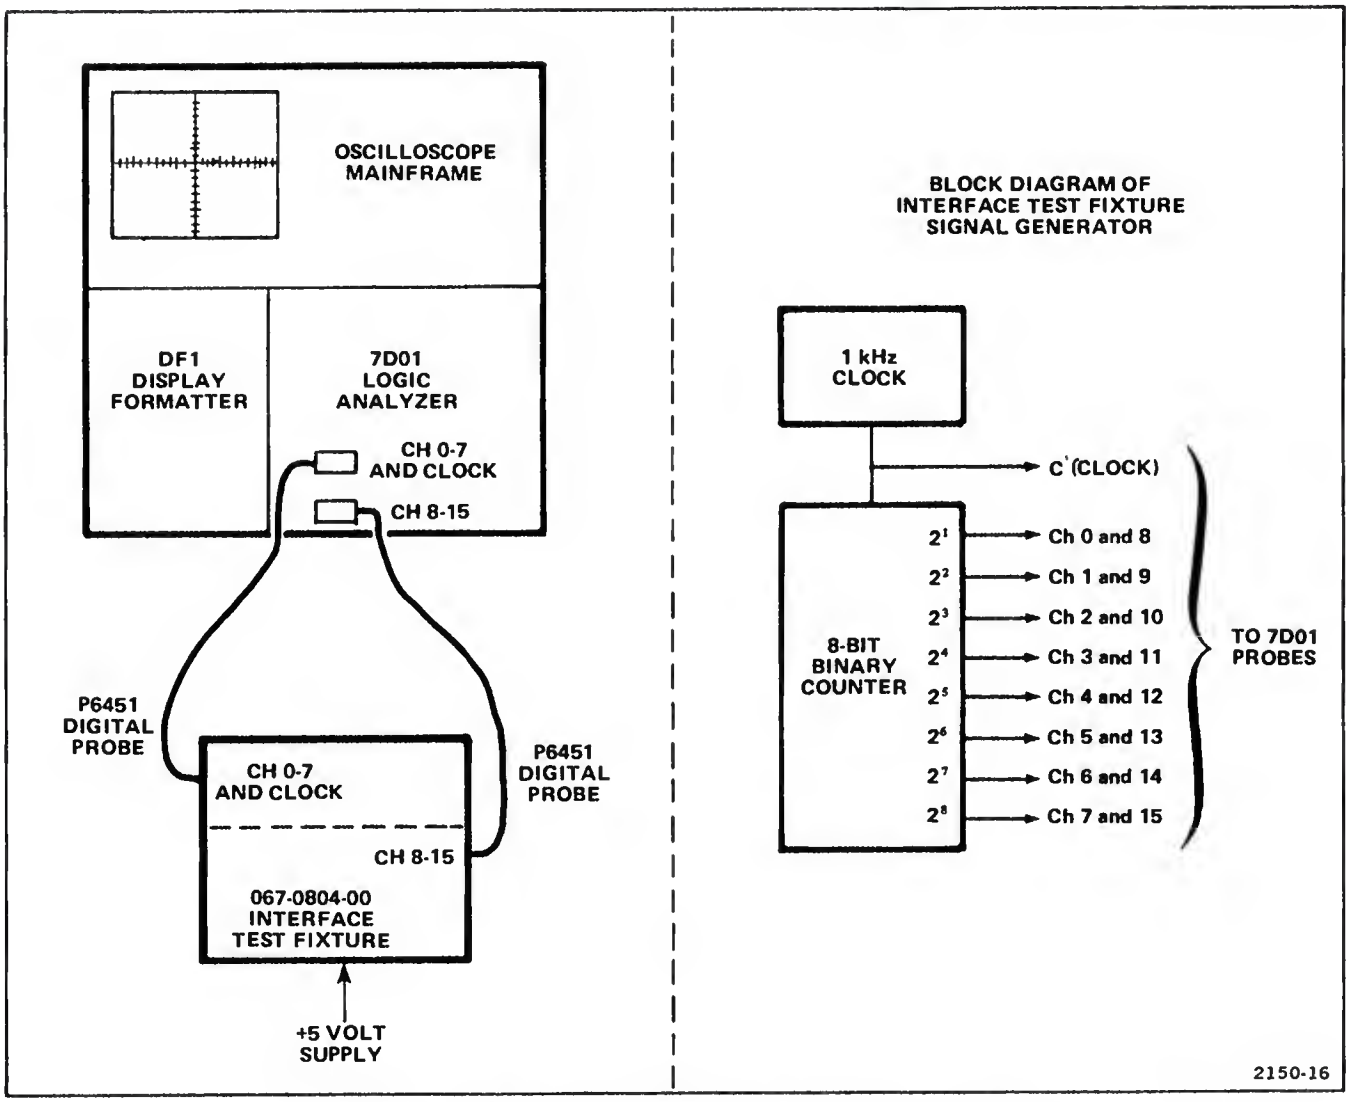

Figure 5-2. Test setup for Performance Check and Adjustment Procedure.

k. Press the Record Manual Reset push button and repeat parts c through i.

l. Change the 7D01 Data Channels switch to 0-15 position and the Data Position switch to Pre Trig position.

m. Press the Record Manual Reset push button and repeat parts c through i.

2. Check Old Data.

a. Perform Preliminary Procedure.

b. Adjust mainframe intensity and 7D01 Vert and Horiz controls for a well-defined Timing Diagram display.

c. Change 7D01 Trigger Source switch to Ch 0 position and press the Record Manual Reset push button.

d. Rotate the 7D01 Cursor Fine Pos control counter-clockwise until the cursor intensified spots disappear.

e. Check that the cursor readout (bottom of display) disappears at the same time as the cursor intensified spots.

f. Repeat parts c through e for all positions of the 7D01 Data Position and Data Channels switches.

3. Check Data Acquisition

a. Perform the Preliminary Procedure.

b. Press the STATE TABLE HEX push button.

c. Adjust mainframe intensity for a well-defined display.

d. Check that the top 16 rows of columns 1 and 3 display 0 through F (see Fig. 5-3).

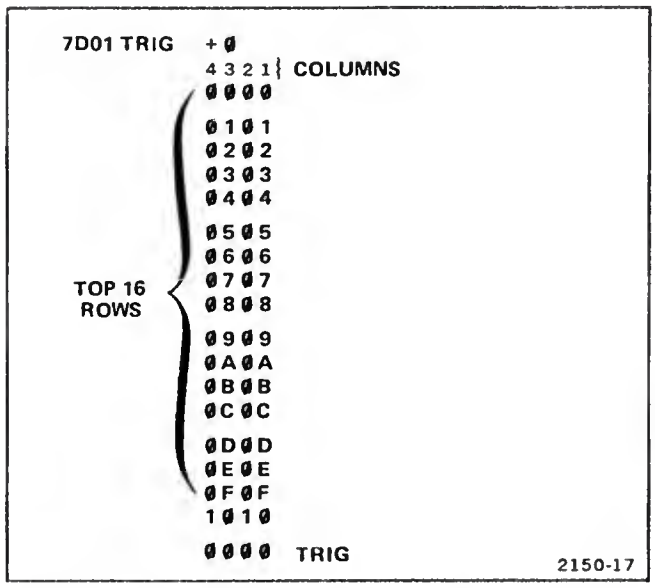

Figure 5-3. Hexadecimal State Table display.

e. Rotate the 7D01 Cursor Coarse position switch one position clockwise at a time. Check that the data displayed in columns 1 and 3 remain the same, and that the top 16 rows of columns 2 and 4 change from all 0's (7D01 TRIG +0), to all 1's (7D01 TRIG +16), etc., through all F's (7D01 TRIG −16). Ignore any X's or *'s in the displays.

f. Change the 7D01 Data Channels switch to 0-7 position and press the Record Manual Reset push button.

g. Rotate the 7D01 Cursor position controls to set the trigger-to-cursor readout to +0.

h. Check that the top 16 rows of column 1 display 0 through F.

i. Rotate the 7D01 Cursor Coarse position switch one position clockwise at a time. Check that the data displayed in column 1 remain the same, and that the top 16 rows of column 2 change from all 0's through all F's twice while the trigger-to-cursor readout advances from +0 through −16. Ignore any X's or *'s in the displays.

j. Change the 7D01 Data Channels switch to 0-3 position and press the Record Manual Reset push button.

k. Rotate the 7D01 Cursor position controls to set the trigger-to-cursor readout to +0.

l. Check that the top 16 rows display 0 through F.

m. Rotate the 7D01 Cursor Coarse position switch clockwise and check that the display remains the same, while the trigger-to-cursor readout advances from +0 through −16. Ignore any X's or *'s in the display.

4. Check Mainframe Readout

a. Perform Preliminary Procedure.

b. Adjust mainframe intensity for a well-defined Timing Diagram display.

c. Note the normal (formatter) readout at the top and bottom of the display.

d. Turn off power to the mainframe and remove the 7D01-DF1 (do not disconnect the probes from the 7D01). Disconnect the DF1 from the 7D01 (refer to Installation, in the General Information section, for instructions).

e. Set the DF1 Readout Source jumper to the MFR (mainframe readout) position.

f. Connect the DF1 to the 7D01 and install into the mainframe.

g. Adjust the mainframe readout intensity control and check that crt readout can be obtained.

h. Press the MAP FAST push button and check that normal (formatter) readout is present.

i. Press the STATE TABLE HEX push button and check that normal readout is present.

j. Turn off power to the mainframe and remove 7D01-DF1.

k. Disconnect the DF1 from the 7D01 and set the DF1 Readout Source jumper to FOR R (formatter readout).

l. Reconnect the DF1 to the 7D01.

5. Check Reset Out Pulse

a. Set the 7D01 for First Trigger mode (internal jumper). Set 7D01 controls as follows:

Sample Interval . . . . . .1 μs
Record Display Time . . . . . .∞
Data Channels. 0-3
Data Position . . . . . .Post Trig
Trigger Source . . . . . .Ch 0
Threshold Voltage . . . . . .Var (±12 V)

Leave all probe tips open.

b. Turn on power to mainframe.

c. Press 7D01 Manual Trigger push button and adjust mainframe intensity and 7D01 Vert and Horiz controls for a well-defined Timing Diagram display (four traces).

d. Connect a voltmeter between the 7D01 Threshold Voltage Monitor jack and ground and set to +2.4 volts.

e. Connect a 1.2-kilohm resistor between the DF1 RESET OUT jack and ground (Figure 5-4A).

f. Connect the Channel 0 probe tip to the RESET OUT jack.

g. Press the RESET IF 7D01=REF push button and check that the 7D01 resets once and displays a HI pulse on channel 0 of the Timing Diagram.

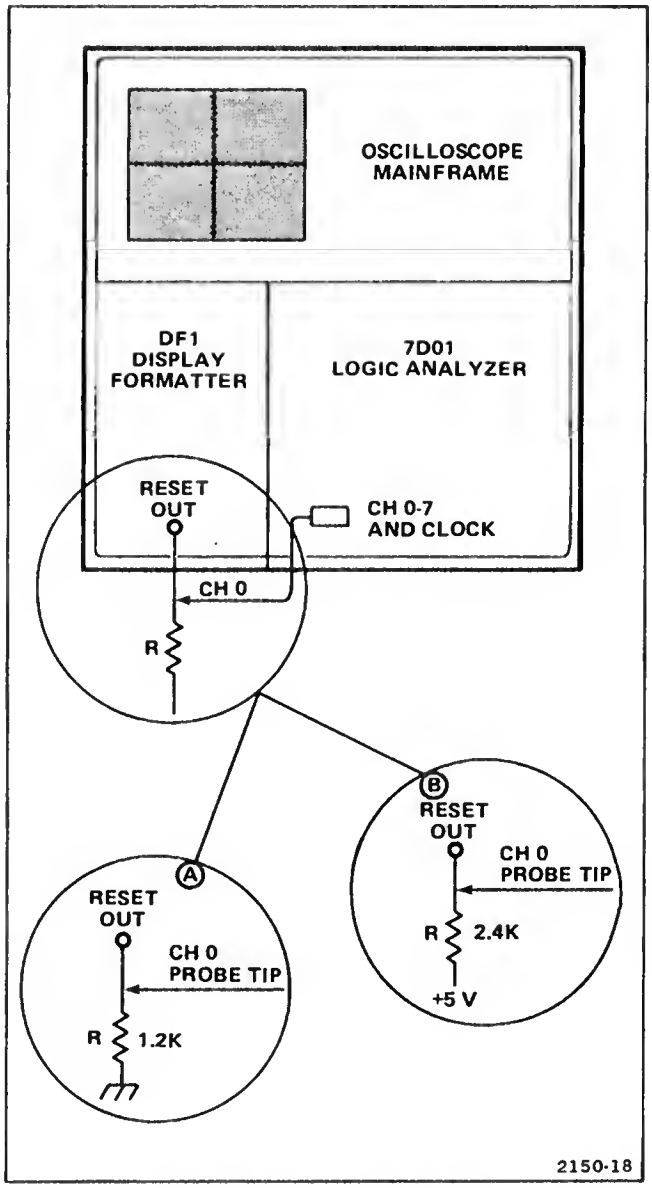

Figure 5-4. Reset Out check test setup.

h. Rotate the 7D01 Cursor position controls to set the cursor intensified dot to the falling edge of the displayed pulse.

i. Check that the trigger-to-cursor readout is at least +50 and less than or equal to +150.

j. Set the 7D01 Threshold Voltage Monitor for +0.4 volts.

k. Disconnect the 1.2-kilohm resistor and Channel 0 probe from the RESET OUT jack.

l. Press the 7D01 Record Manual Reset and Manual Trigger push buttons (in that order).

m. Connect a 2.4-kilohm resistor from a +5-volt supply to the RESET OUT jack (figure 5-4B).

n. Connect the Channel 0 probe to the RESET OUT jack.

o. Press the RESET IF 7D01=REF push button and check that the 7D01 resets once and displays a HI pulse on channel 0 of the Timing Diagram display.

p. Disconnect the 2.4-kilohm resistor and Channel 0 probe from the RESET OUT jack.

q. Turn off power to the mainframe and remove the 7D01-DF1.

r. Disconnect the DF1 from the 7D01 and set the 7D01 to the Full Display mode (internal jumper).

ADJUSTMENT PROCEDURE

1. Adjust Horizontal Gain

a. Perform the Preliminary Procedure. (Do NOT set 7D01 to First Trigger mode.)

b. Press MAP FAST push button and adjust mainframe intensity control for well-defined Map display (diagonal line).

c. Adjust the front-panel HORIZ POSN screwdriver adjustment to position the left end of the Map display to the left edge of the crt graticule.

d. Note the position of the right end of the Map display relative to the edge of the crt graticule. The right end of the display should be within 0.2 division from the right edge of the graticule.

e. If adjustment of the horizontal gain is required; turn off the power to the mainframe, partially remove the 7D01-DF1 from the mainframe, and adjust the Horiz Gain screwdriver adjustment (accessible through the top rail of the DF1). (Clockwise rotation of the control reduces the horizontal gain.)

f. Check the resultant adjustment by re-inserting the 7D01-DF1 into the mainframe, applying power, and pressing the MAP FAST push button.

g. Repeat parts e and f as required.

REPLACEABLE ELECTRICAL PARTS

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

X000	Part first added at this serial number
00X	Part removed after this serial number

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

ABBREVIATIONS

ACTR	ACTUATOR	PLSTC	PLASTIC
ASSY	ASSEMBLY	OTZ	QUARTZ
CAP	CAPACITOR	RECP	RECEPTACLE
CER	CERAMIC	RES	RESISTOR
CKT	CIRCUIT	RF	RADIO FREQUENCY
COMP	COMPOSITION	SEL	SELECTED
CONN	CONNECTOR	SEMICOND	SEMICONDUCTOR
ELCTLT	ELECTROLYTIC	SENS	SENSITIVE
ELEC	ELECTRICAL	VAR	VARIABLE
INCAND	INCANDESCENT	WW	WIREWOUND
LED	LIGHT EMITTING DIODE	XFMR	TRANSFORMER
NONWIR	NON WIREWOUND	XTAL	CRYSTAL

CROSS INDEX—MFR. CODE NUMBER TO MANUFACTURER

INSTRUMENT OPTIONS

No options were available for this instrument at the time of this printing.

Information on any subsequent options may be found in the CHANGE INFORMATION section in the back of this manual.

DIAGRAMS AND CIRCUIT BOARD ILLUSTRATIONS

Symbols and Reference Designators

Electrical components shown on the diagrams are in the following units unless noted otherwise:

Capacitors	=	Values one or greater are in picofarads (pF). Values less than one are in microfarads (μs).
Resistors	=	Ohms (Ω).

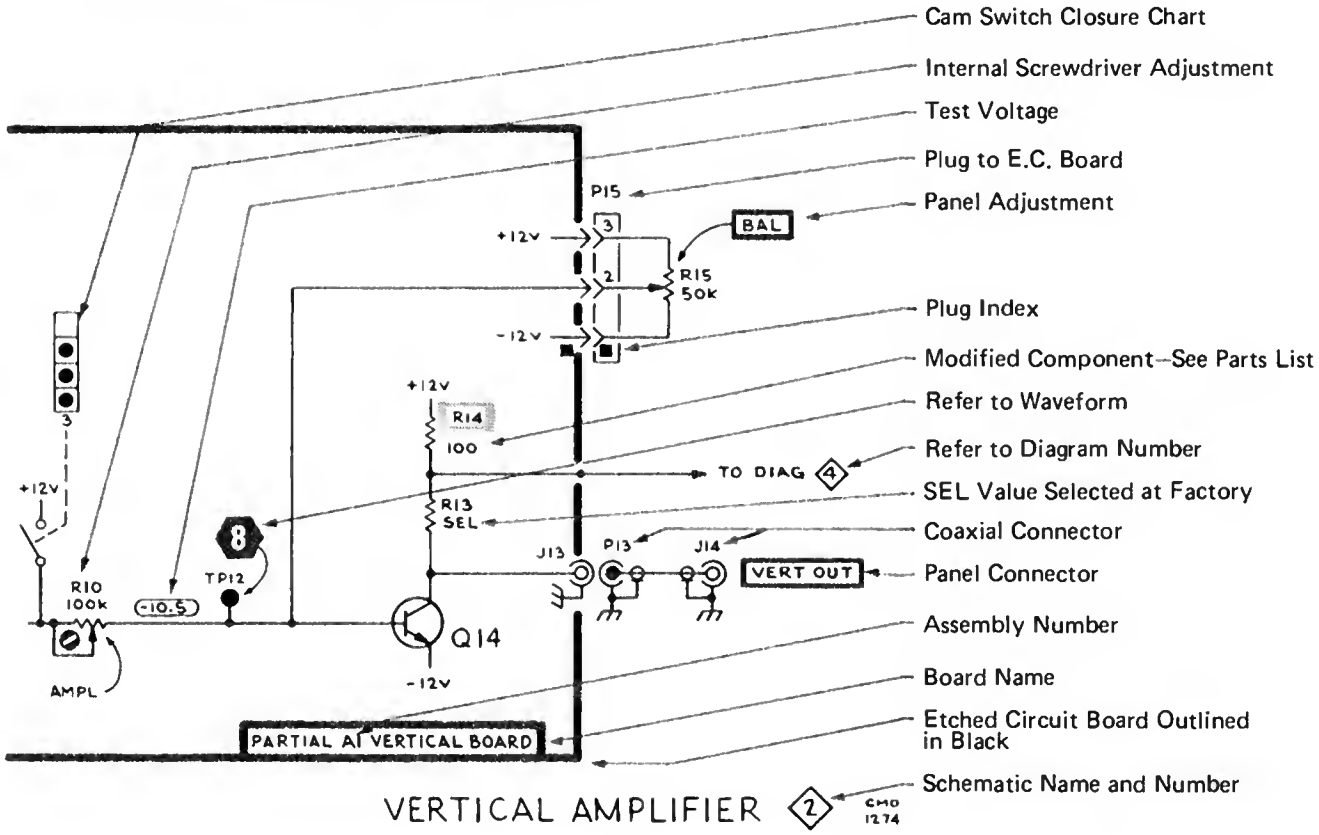
Symbols used on the diagrams are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI Y32.14-1973 in terms of positive logic. Logic symbols depict the logic function pe formed and may differ from the manufacturer's data.

The following prefix letters are used as reference designators to identify components or assemblies on the diagrams.

A	Assembly, separable or repairable (circuit board, etc.)
AT	Attenuator, fixed or variable
B	Motor
BT	Battery
C	Capacitor, fixed or variable
CB	Circuit breaker
CR	Diode, signal or rectifier
DL	Delay line
DS	Indicating device (lamp)
E	Spark Gap
F	Fuse
FL	Filter
H	Heat dissipating device (heat sink, heat radiator, etc.)
HR	Heater
HY	Hybrid circuit
J	Connector, stationary portion
K	Relay
L	Inductor, fixed or variable
LR	Inductor/resistor combination
M	Meter
P	Connector, movable portion
Q	Transistor or silicon-controlled rectifier
R	Resistor, fixed or variable
RT	Thermistor
S	Switch
T	Transformer
TC	Thermocouple
TP	Test point
U	Assembly, inseparable or non-repairable (integrated circuit, etc.)
V	Electron tube
VR	Voltage regulator (zener diode, etc.)
Y	Crystal
Z	Phase shifter

The following special symbols are used on the diagrams:



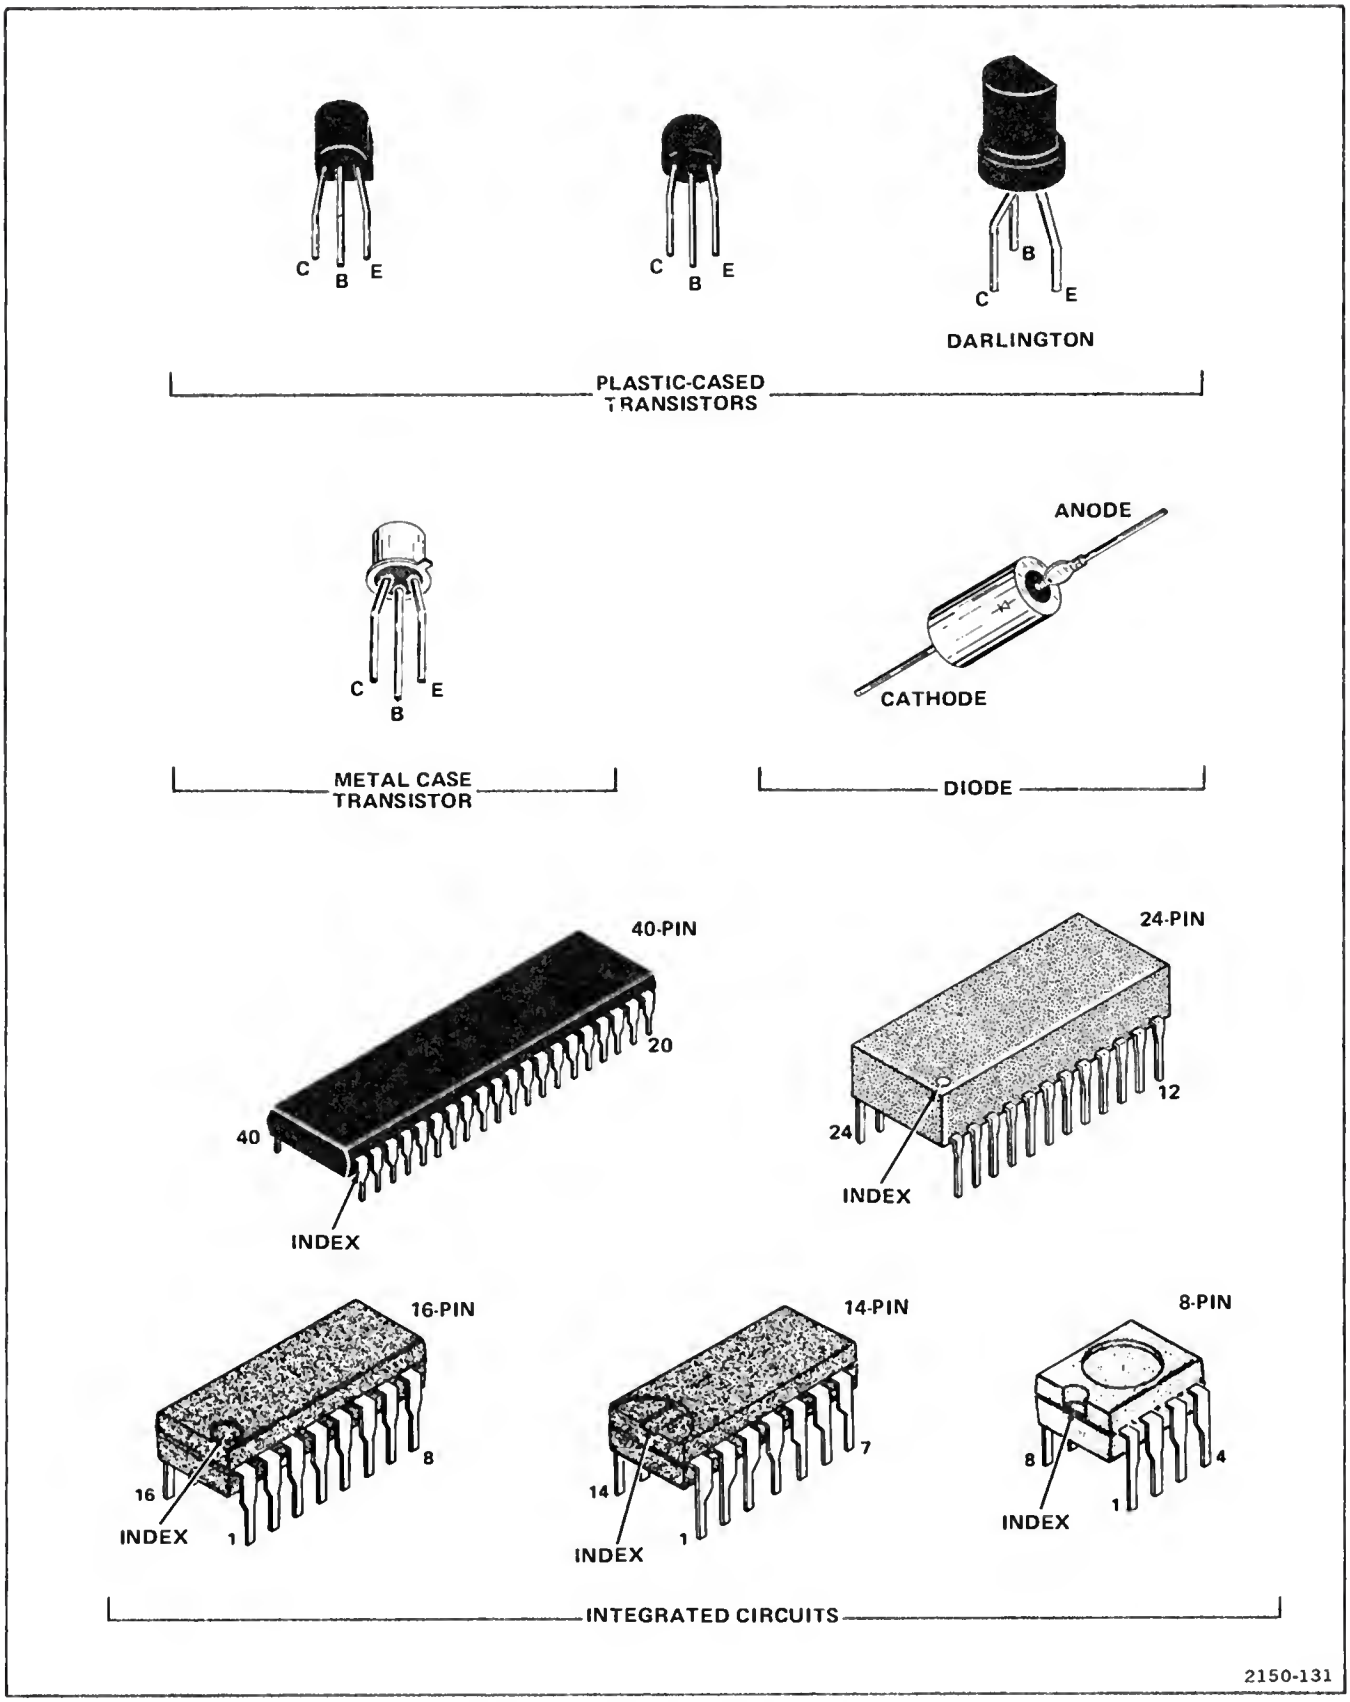


Figure 8-1. Semiconductor lead configurations.

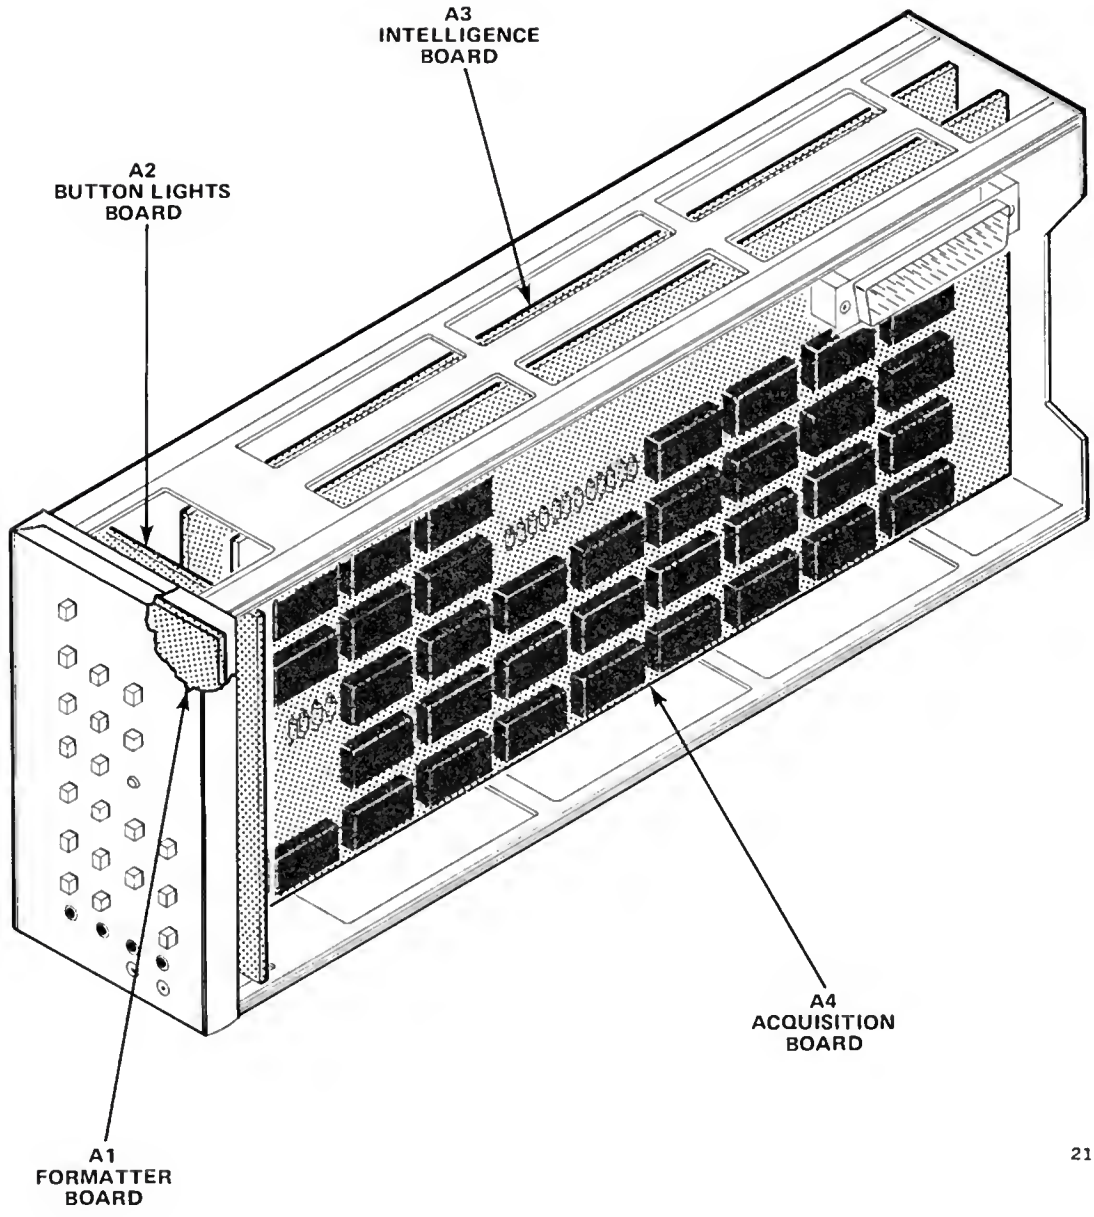

Figure 8-2. Circuit board locations.

VOLTAGE AND WAVEFORM CONDITIONS

Voltages and waveforms shown are typical, but may vary between instruments.

TEST SETUP: The 7D01 is connected to the 7000-series mainframe Right-Vertical and A-Horizontal compartments through two 067-0616-00 Flexible Plug-in Extenders. The DF1 is connected to the 7D01 through a 067-0805-00 Cable Extender. The DF1 is set for a STATE TABLE BINARY, 7D01 ONLY display.

The test oscilloscope is dc coupled and internally triggered.

VOLTAGE AND WAVEFORM CONDITIONS

Voltages and waveforms shown are typical, but may vary between instruments.

TEST SETUP: The 7D01 is connected to the 7000-series mainframe Right-Vertical and A-Horizontal compartments through two 067-0616-00 Flexible Plug-in Extenders. The DF1 is connected to the 7D01 through a 067-0805-00 Cable Extender. The DF1 is set for a STATE TABLE BINARY, 7D01 ONLY display.

The test oscilloscope is dc coupled and internally triggered.

REPLACEABLE MECHANICAL PARTS

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

X000	Part first added at this serial number
00X	Part removed after this serial number

FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

1 2 3 4 5 Name & Description

Assembly and/or Component
Attaching parts for Assembly and/or Component
- - - * - - -
Detail Part of Assembly and/or Component
Attaching parts for Detail Part
- - - * - - -
Parts of Detail Part
Attaching parts for Parts of Detail Part
- - - * - - -

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol - - - * - - - indicates the end of attaching parts.

Attaching parts must be purchased separately, unless otherwise specified.

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

MANUAL CHANGE INFORMATION

At Tektronix, we continually strive to keep up with latest electronic developments by adding circuit and component improvements to our instruments as soon as they are developed and tested.

Sometimes, due to printing and shipping requirements, we can't get these changes immediately into printed manuals. Hence, your manual may contain new change information on following pages.

A single change may affect several sections. Since the change information sheets are carried in the manual until all changes are permanently entered, some duplication may occur. If no such change pages appear following this page, your manual is correct as printed.

SERVICE NOTE

Because of the universal parts procurement problem, some electrical parts in your instrument may be different from those described in the Replaceable Electrical Parts List. The parts used will in no way alter or compromise the performance or reliability of this instrument. They are installed when necessary to ensure prompt delivery to the customer. Order replacement parts from the Replaceable Electrical Parts List.

CALIBRATION TEST EQUIPMENT REPLACEMENT

Calibration Test Equipment Chart

This chart compares TM 500 product performance to that of older Tektronix equipment. Only those characteristics where significant specification differences occur, are listed. In some cases the new instrument may not be a total functional replacement. Additional support instrumentation may be needed or a change in calibration procedure may be necessary.

Comparison of Main Characteristics

DM 501 replaces 7D13		
PG 501 replaces 107	PG 501 - Risetime less than 3.5 ns into 50 Ω.	107 - Risetime less than 3.0 ns into 50 Ω.
108	PG 501 - 5 V output pulse; 3.5 ns Risetime.	108 - 10 V output pulse; 1 ns Risetime.
111	PG 501 - Risetime less than 3.5 ns; 8 ns Pretrigger pulse delay.	111 - Risetime 0.5 ns; 30 to 250 ns Pretrigger Pulse delay.
114	PG 501 - ±5 V output.	114 - ±10 V output. Short proof output.
115	PG 501 - Does not have Paired, Burst, Gated, or Delayed pulse mode; ±5 V dc Offset. Has ±5 V output.	115 - Paired, Burst, Gated, and Delayed pulse mode; ±10 V output. Short-proof output.
PG 502 replaces 107		
108	PG 502 - 5 V output	108 - 10 V output.
111	PG 502 - Risetime less than 1 ns; 10 ns Pretrigger pulse delay.	111 - Risetime 0.5 ns; 30 to 250 ns Pretrigger pulse delay.
114	PG 502 - ±5 V output	114 - ±10 V output. Short proof output.
115	PG 502 - Does not have Paired, Burst, Gated, Delayed & Undelayed pulse mode; Has ±5 V output.	115 - Paired, Burst, Gated, Delayed & Undelayed pulse mode; ±10 V output. Short-proof output.
2101	PG 502 - Does not have Paired or Delayed pulse. Has ±5 V output.	2101 - Paired and Delayed pulse; 10 V output.
PG 506 replaces 106	PG 506 - Positive-going trigger output signal at least 1 V; High Amplitude output, 60 V.	106 - Positive and Negative-going trigger output signal, 50 ns and 1 V; High Amplitude output, 100 V.
067-0502-01	PG 506 - Does not have chopped feature.	0502-01 - Comparator output can be alternately chopped to a reference voltage.
SG 503 replaces 190, 190A, 190B	SG 503 - Amplitude range 5 mV to 5.5 V p-p.	190B - Amplitude range 40 mV to 10 V p-p.
191	SG 503 - Frequency range 250 kHz to 250 MHz.	191 - Frequency range 350 kHz to 100 MHz.
067-0532-01	SG 503 - Frequency range 250 kHz to 250 MHz.	0532-01 - Frequency range 65 MHz to 500 MHz.
TG 501 replaces 180, 180A	TG 501 - Marker outputs, 5 sec to 1 ns. Sinewave available at 5, 2, and 1 ns. Trigger output - slaved to marker output from 5 sec through 100 ns. One time-mark can be generated at a time.	180A - Marker outputs, 5 sec to 1 μs. Sinewave available at 20, 10, and 2 ns. Trigger pulses 1, 10, 100 Hz; 1, 10, and 100 kHz. Multiple time-marks can be generated simultaneously.
181	TG 501 - Marker outputs, 5 sec to 1 ns. Sinewave available at 5, 2, and 1 ns.	181 - Marker outputs, 1, 10, 100, 1000, and 10,000 μs, plus 10 ns sinewave.
184	TG 501 - Marker outputs, 5 sec to 1 ns. Sinewave available at 5, 2, and 1 ns. Trigger output - slaved to marker output from 5 sec through 100 ns. One time-mark can be generated at a time.	184 - Marker outputs, 5 sec to 2 ns. Sinewave available at 50, 20, 10, 5, and 2 ns. Separate trigger pulses of 1 and .1 sec; 10, 1, and .1 ms; 10 and 1 μs. Marker amplifier provides positive or negative time marks of 25 V min. Marker intervals of 1 and .1 sec; 10, 1, and .1 ms; 10 and 1 μs.
2901	TG 501 - Marker outputs, 5 sec to 1 ns. Sinewave available at 5, 2, and 1 ns. Trigger output - slaved to marker output from 5 sec through 100 ns. One time-mark can be generated at a time.	2901 - Marker outputs, 5 sec to 0.1 μs. Sinewave available to 50, 10, and 5 ns. Separate trigger pulses, from 5 sec to 0.1 μs. Multiple time-marks can be generated simultaneously.

NOTE: All TM 500 generator outputs are short-proof. All TM 500 plug-in instruments require TM 500-Series Power Module.
